Prototype

This section discussed the prototype design and functionalities of the San Pedro Animal Shelter Management System. It outlined the key features, user interface components, and system processes across various modules. The design highlighted how each component supported the goal of improving pet adoption operations, staff workflows, and shelter management through AI-driven matching, QR identification, and chatbot support.

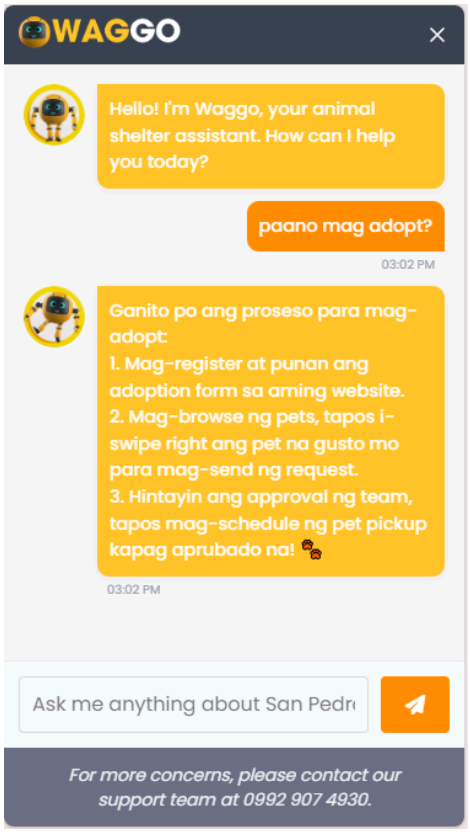

Figure 1. Home Page

The Home Page of the San Pedro Animal Shelter Management System was a single, scrollable section that served as the landing page for all users. Its design displayed the system and the pet adoption initiative through an overview section. A static navigation bar was positioned at the top of the page, featuring the system logo and the name “San Pedro Animal Shelter” alongside navigation

links: Home, Features, Announcement, Support Us, and Login/Sign Up buttons. The first three navigation links used anchor links that redirected users to specific sections of the homepage without the need to scroll manually. This design improved the user experience by offering quick and efficient access to important information.

Figure 2. Waggo FAQ Chatbot

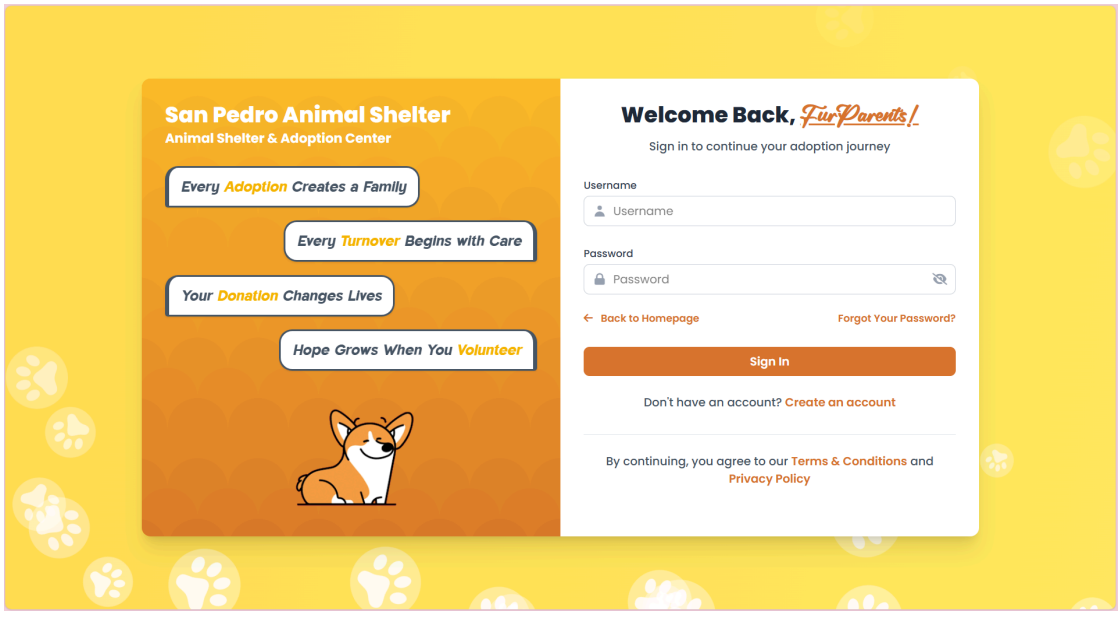

Waggo, an AI-powered interactive chatbot, was integrated into the system to assist users in navigating the platform and accessing relevant services with ease. Waggo allowed users to ask personalized questions related to pet adoption, turnover, volunteering, donations, and other shelter processes.

Through natural language processing, it interpreted user input and generated real-time responses tailored to each user's needs.

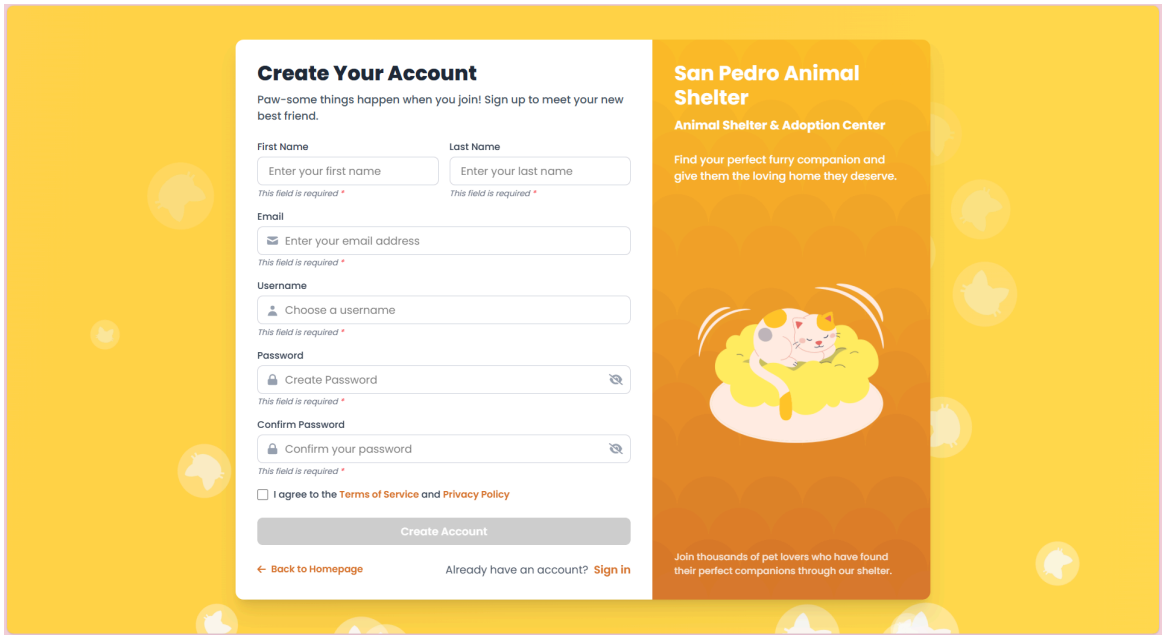

From a system architecture perspective, Waggo reduced the burden on human administrators by automating a broad range of user support functions and delivering accurate, consistent information. Its conversational design enhanced usability for both technical and non-technical users, promoting smoother interaction. Beyond just being a help tool, Waggo fostered deeper engagement by acting as a reliable digital assistant, empowering users to explore the platform more confidently and intuitively. Its integration strengthened the communication bridge between the organization and its users, resulting in a more supportive, informed, and accessible system experience.

Figure 3. Login Page

The login page of the San Pedro Animal Shelter Management System provided access to authorized users such as administrators, shelter staff and client panel. It included input fields for the username and password, a Sign In button, and a "Forgot Your Password?" link. Users who forgot their credentials could click the link to begin the account recovery process by verifying their identity. The interface also included a “Create an Account” link to allow new users to register. This authentication design ensured secure access control while maintaining ease of use for system operators.

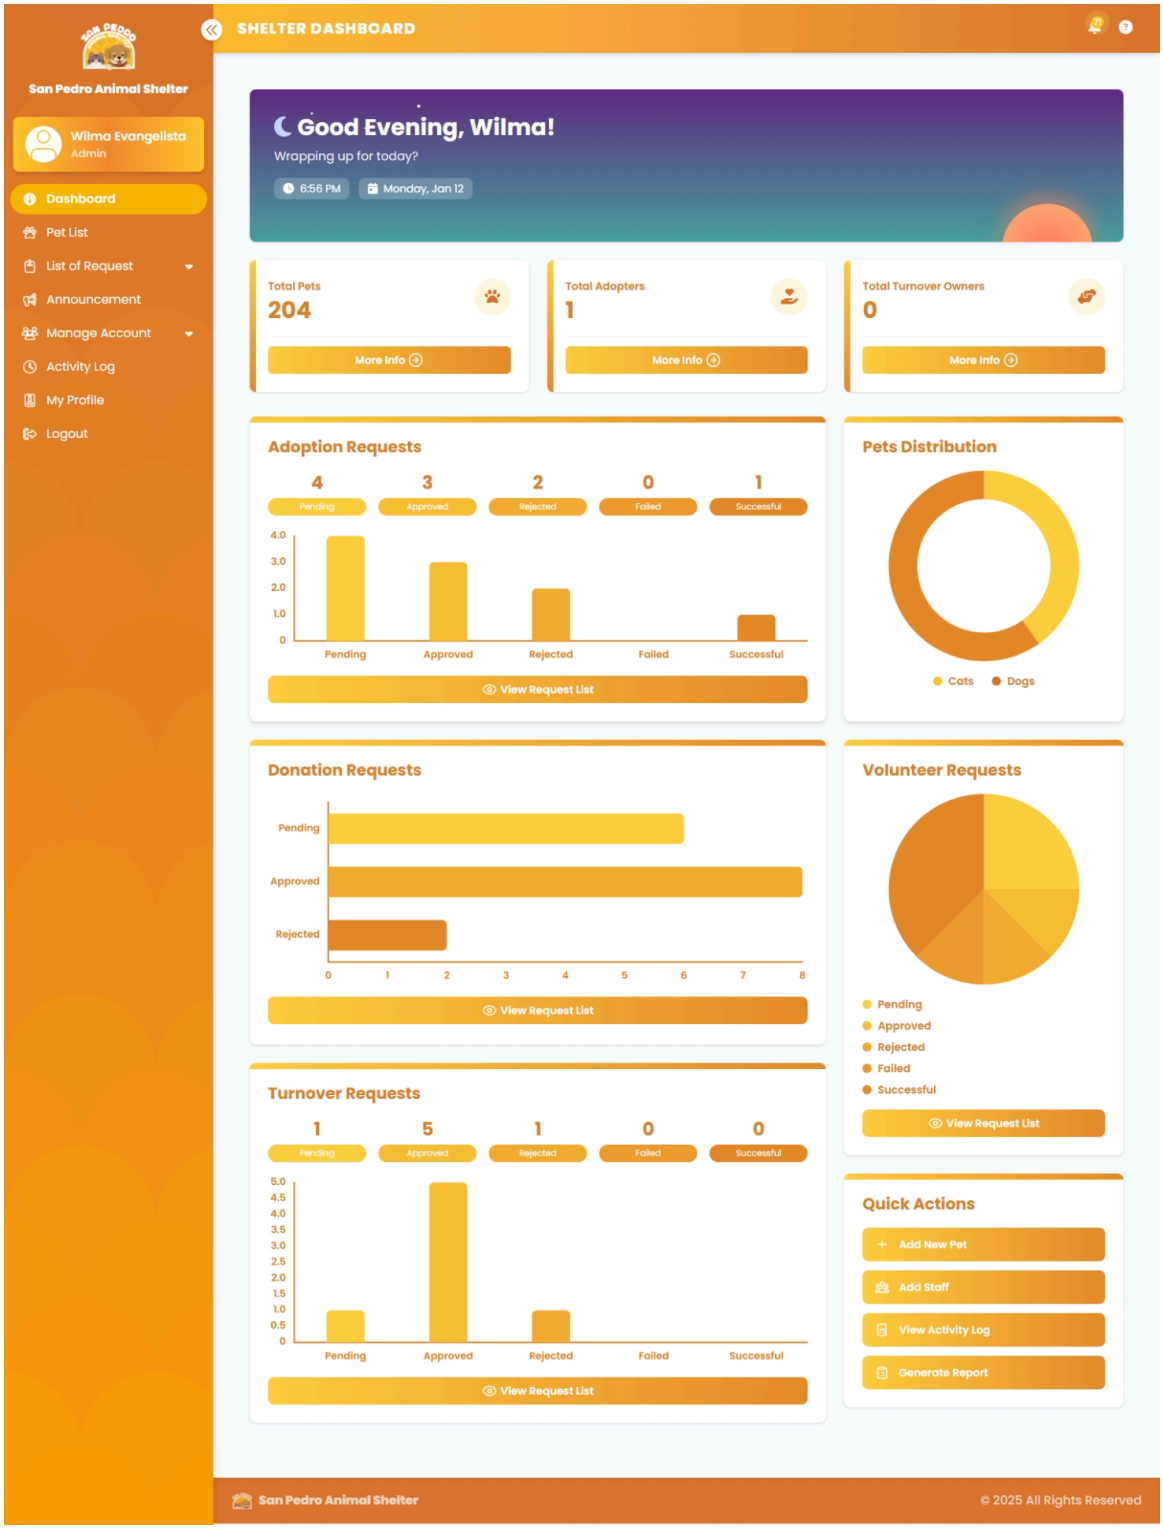

Figure 4. Signup Page

The sign-up page allowed new users to register an account in the system. It required the user’s first name, last name, email, username, password, and to re-type their password in the confirm password field. A checkbox for “I agree to the Terms of Service and Privacy Policy” had to be checked before creating an

account. The “Create an Account” button finalized the registration process. For users who already had an account, a “Sign In” link was provided for easy navigation to the login page. This page ensured that all essential information was collected for user validation while promoting proper agreement to system policies.

Figure 5. Admin Dashboard Overview

The Admin Dashboard is designed as the central hub for administrators after successfully logging into the system. It provides a comprehensive overview of key operational metrics, such as the total number of pets, total adopters, and total turnover owners. These figures offer immediate insight into the overall status of shelter activities.

A set of visual graphs is included to aid in the quick analysis of the following areas: Adoption Requests categorized as Approved, Pending, Rejected, Failed, and Successful. It also illustrates Pet Distributions between Cats and Dogs, as well as Volunteer Requests and Turnover Requests, both organized using the same five status categories.

Each data visualization section features interactive options like “View Request List” or “More Info”, which redirect the admin to relevant tables or dedicated pages for deeper exploration. This design ensures that detailed records are always within reach while maintaining a clean interface.

Aside from the visual graphs, the admin dashboard is designed with a section featuring quick action options for the user to choose from. These actions include “Add New Pet”, “Add Staff”, “View Activity Log”, “Generate Report”. The consistent layout across all redirected pages supports ease of use and ensures that the admin can manage operations across different functional areas without confusion. Additionally, a dynamic greeting message is displayed at the top of the dashboard. These components support a streamlined user experience and promote ease of access to all major functions within the admin interface.

Figure 6. Staff Dashboard Overview

The Staff Dashboard was almost the same as the Admin Dashboard in structure and navigation but was specifically designed to focus on the tasks assigned to staff members. Unlike the Admin Dashboard, the Staff Dashboard focused on operational tasks that staff members actively handled. It featured key panels such as Posted Announcements, Recorded Donations, Pets Distribution, and Total Pets, giving a clear overview of daily shelter activities.

Quick actions available to staff included “Generate Report,” “Add Pet,” and “Create Announcement,” enabling them to perform core duties efficiently. Unlike the admin, staff members did not have access to functions such as creating staff accounts or viewing the activity logs. The layout supported the staff’s role by providing access to essential data and tools for pet handling and public communication, without exposing sensitive or high-level administrative controls. This setup ensured that staff can stay productive within the scope of their responsibilities.

Figure 7. Client Panel Dashboard Overview

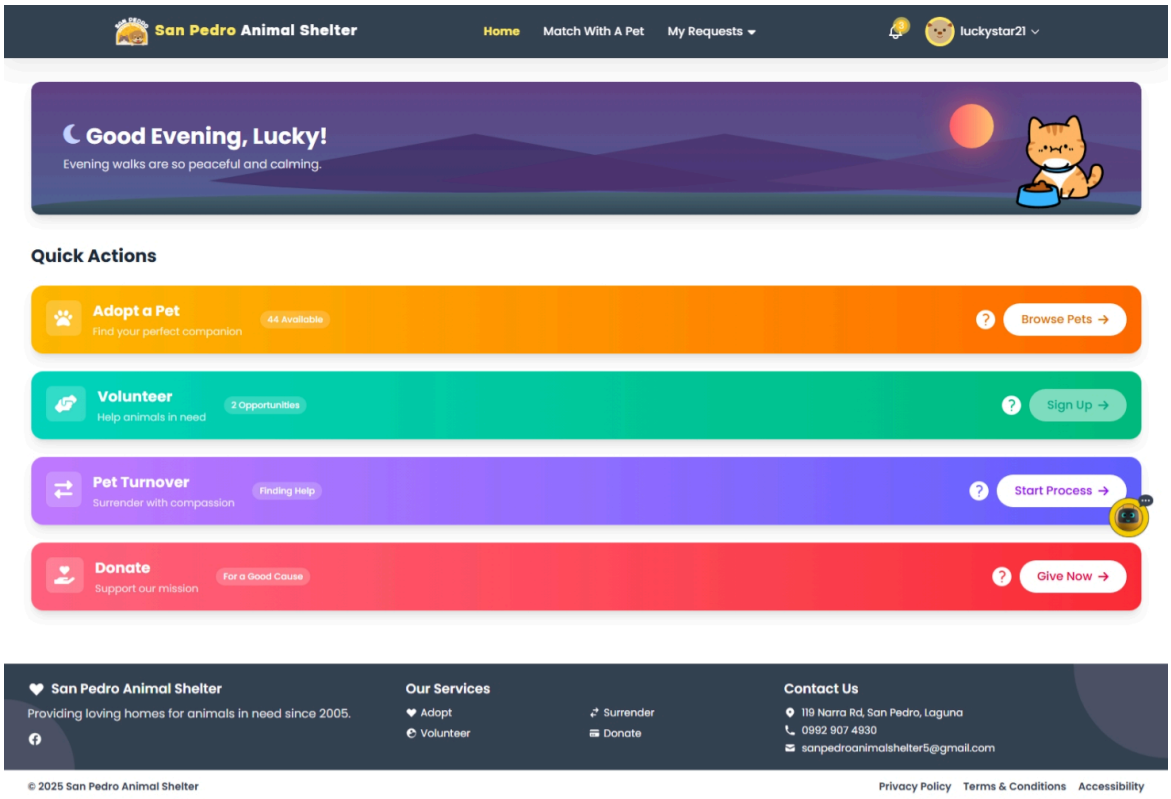

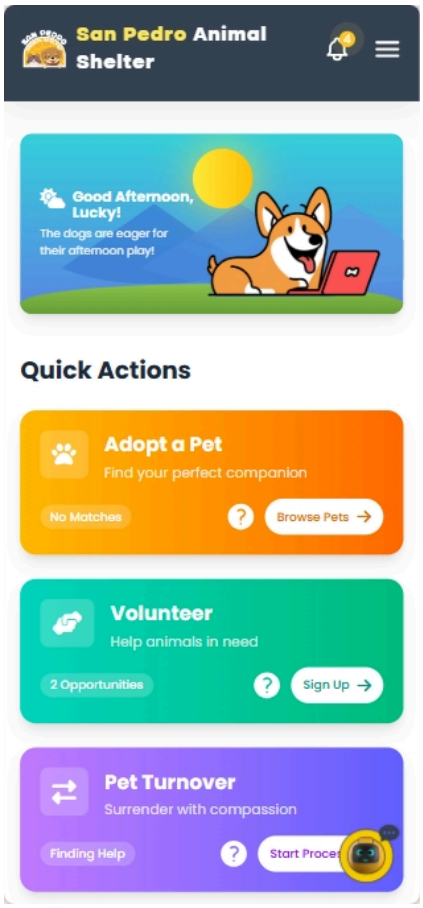

Figure 8. Client Panel Dashboard Overview - Mobile View

Upon login, users under the client panel such as adopters, donors, volunteers, or turnover owners were redirected to a personalized Client Dashboard. Like the admin counterpart, this dashboard opened with a warm greeting message based on time, setting a welcoming tone.

It included several Quick Action Cards such as Adopt a Pet for initializing pet browsing and adoption, Volunteer for displaying available volunteer opportunities, Pet Turnover for starting the multi-step surrender form, and Donate which led to a secure donation form. Each card was paired with brief info and a

"Start" or "Browse" button to encourage engagement. In addition, each process card within the client dashboard was equipped with a question mark icon designed to enhance user guidance and system transparency. These icons functioned as contextual help tools that, when clicked, displayed a detailed step-by-step explanation of the respective process. The inclusion of these interactive elements aimed to assist users in understanding the necessary procedures before initiating any action. The layout also included the shelter's mission statement, contact details, and footer navigation for easy access to other public pages.

Figure 9. My Profile (Client Panel View)

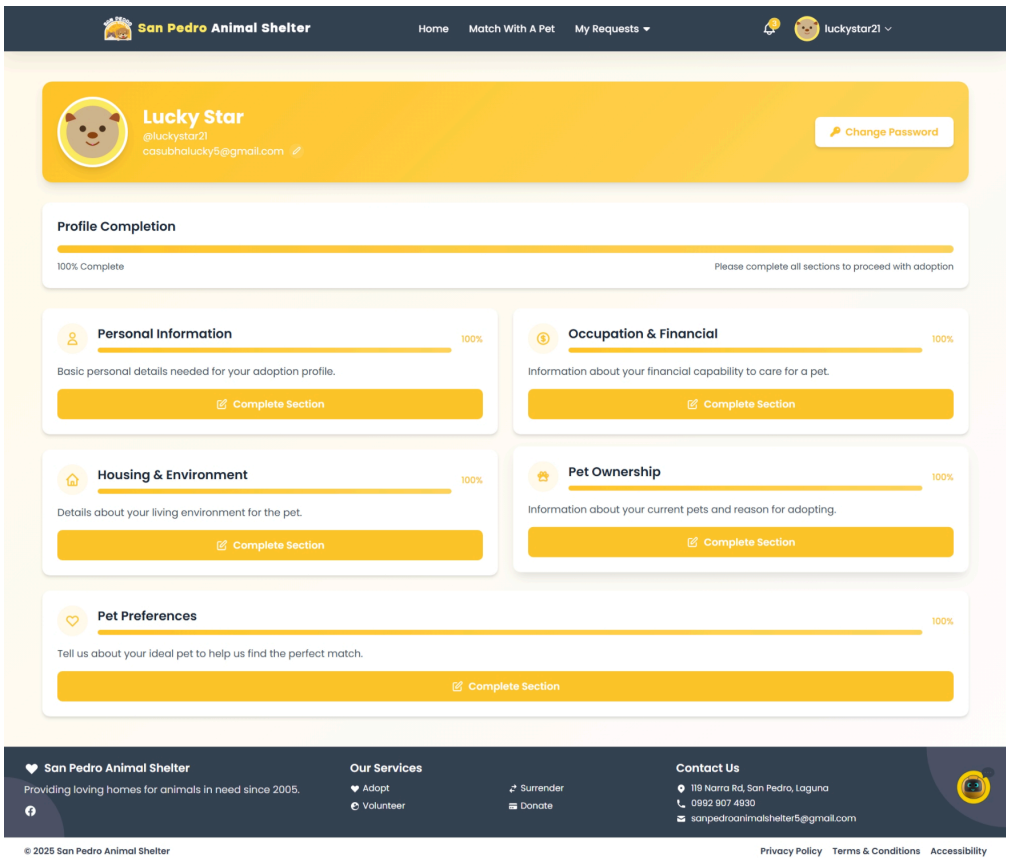

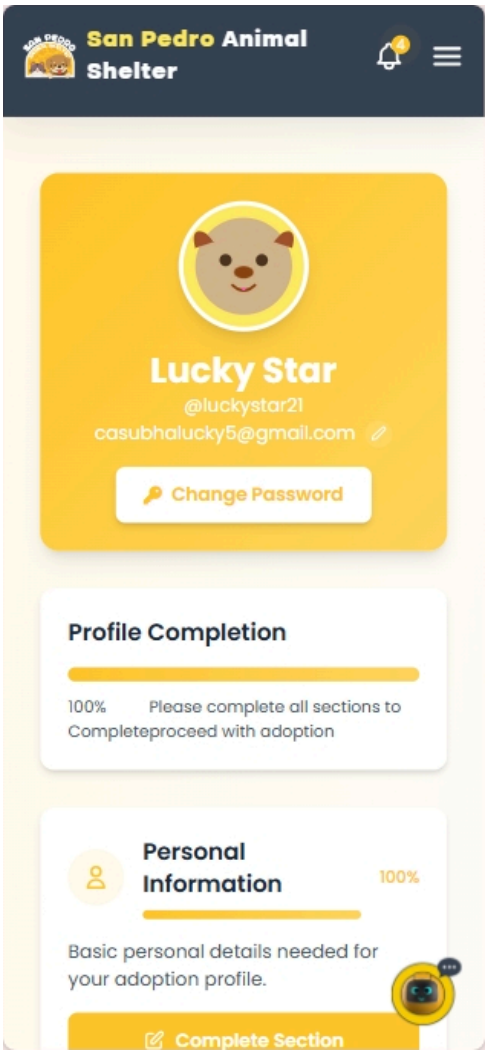

Figure 10. My Profile (Client Panel View) - Mobile View

The My Profile section in the client panel played an important role in the adoption process within the animal shelter management system. All relevant personal data entered in the adoption form was stored and displayed on this page. The Adoption Form served as a crucial component of the animal shelter management system, enabling interested individuals to formally express their intent to adopt a pet. This was designed to gather comprehensive information from users through categorized tabs such as Personal Info, Occupation & Financial Status, Housing & Environment, Pet Ownership, and Pet Preferences

ensuring that the shelter had a well-rounded understanding of each adopter's background and suitability.

In addition to updating form responses, users were also given control over key account functions. They could change their password to maintain account security and update their profile picture to personalize their account. The system ensured that users remain engaged and empowered to manage their profiles actively; supporting not only adoption processes but also volunteer involvement, donations, and other interactions with the shelter.

Figure 11. Personalized Pet Matching Page (Client Panel View)

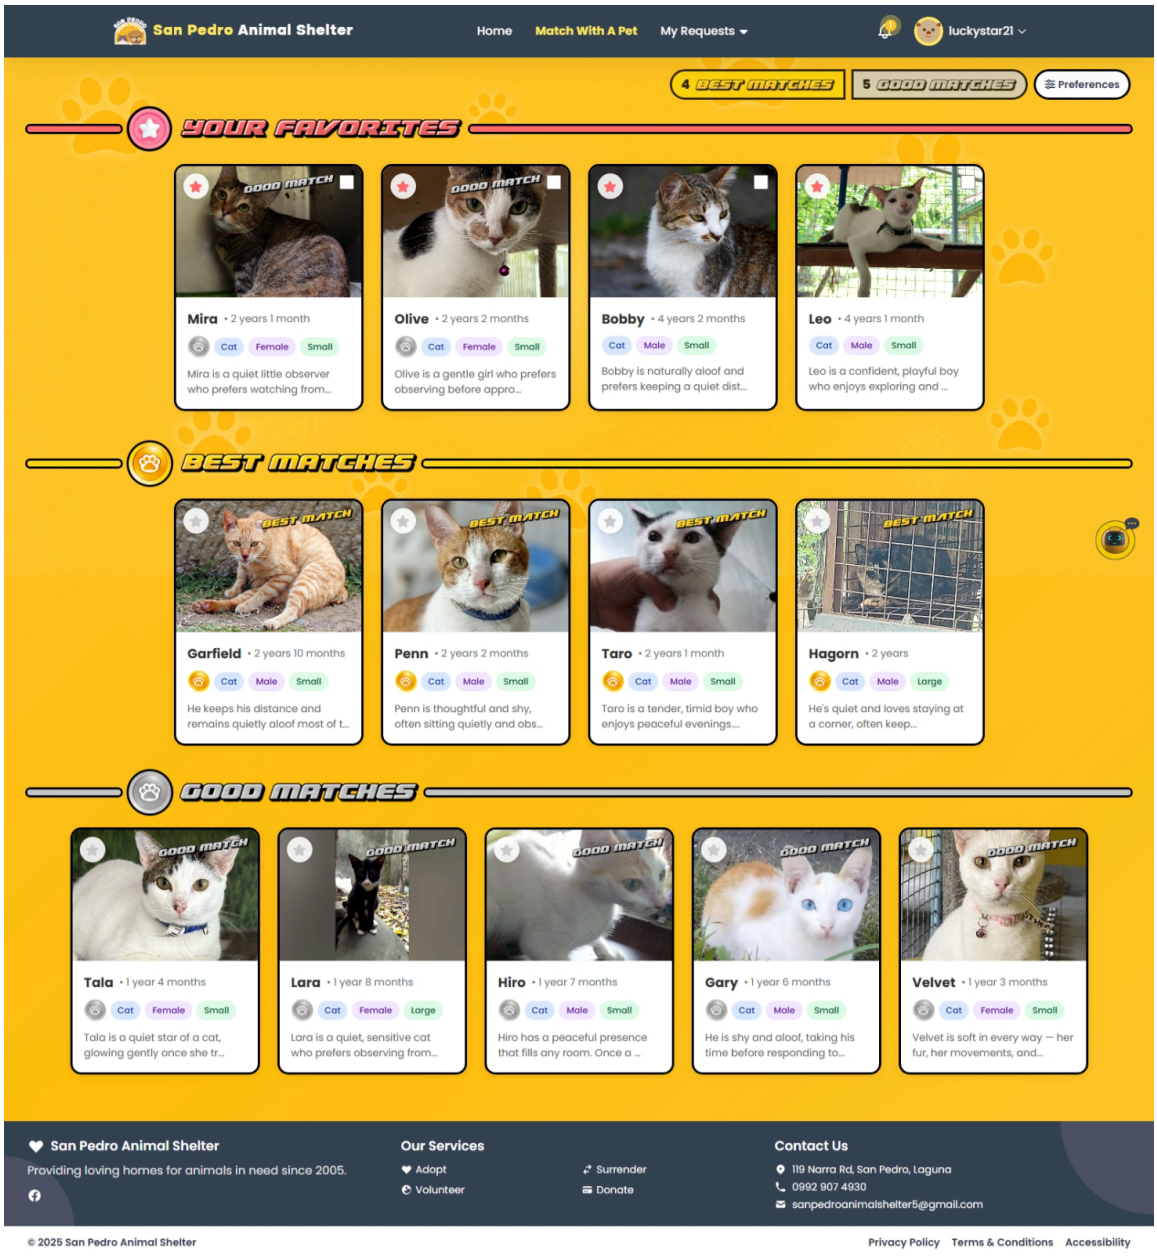

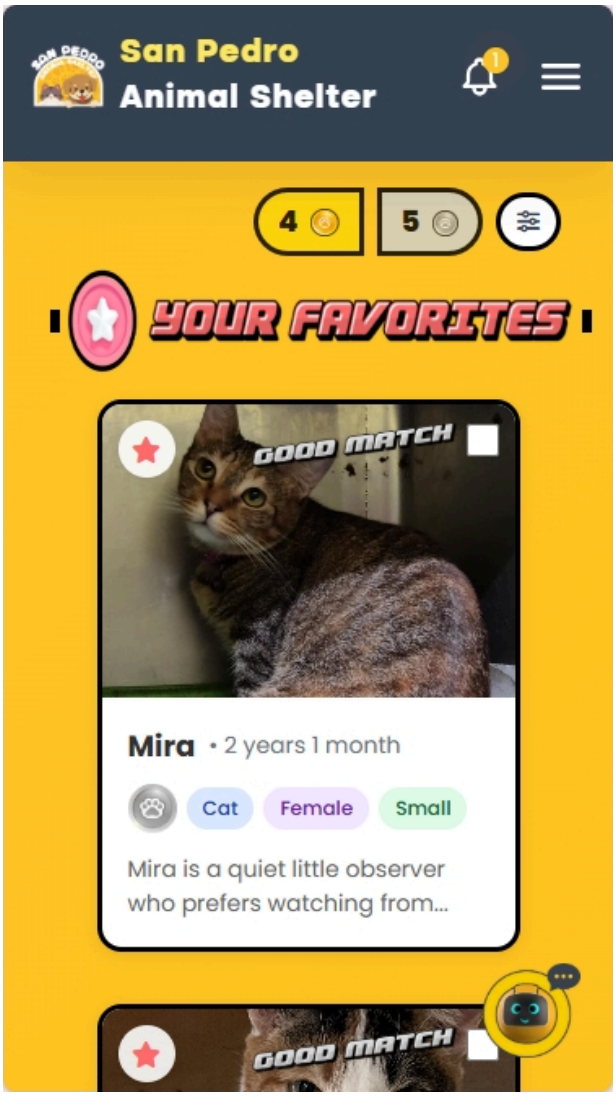

Figure 12. Personalized Pet Matching Page (Client Panel View) - Mobile View

The Match With A Pet page was designed to provide users with a personalized and engaging experience in finding adoptable pets that best fit their preferences. The layout included three main sections: My Favorites, Best Matches, and Good Matches, each displaying pet profile cards arranged in a grid-based format. Each card contained essential details such as the pet's name, age, and personality traits, along with an image to help users visually connect with the animals. A Preferences button was also placed prominently on the

interface, allowing users to update their desired criteria such as pet type, gender, personality, or temperament to refine their list of matches. The design aimed to balance functionality and visual appeal, to convey warmth and friendliness.

The My Favorites section was conceptualized to store pets marked by users for easy access and comparison, while the Best Matches and Good Matches sections visually categorized recommendations based on compatibility scores derived from user preferences. Overall, the Match With A Pet page aimed to deliver a user-centered design that would encourage adoption interest by making the browsing experience both simple and emotionally engaging.

Figure 13. Pet Swipe

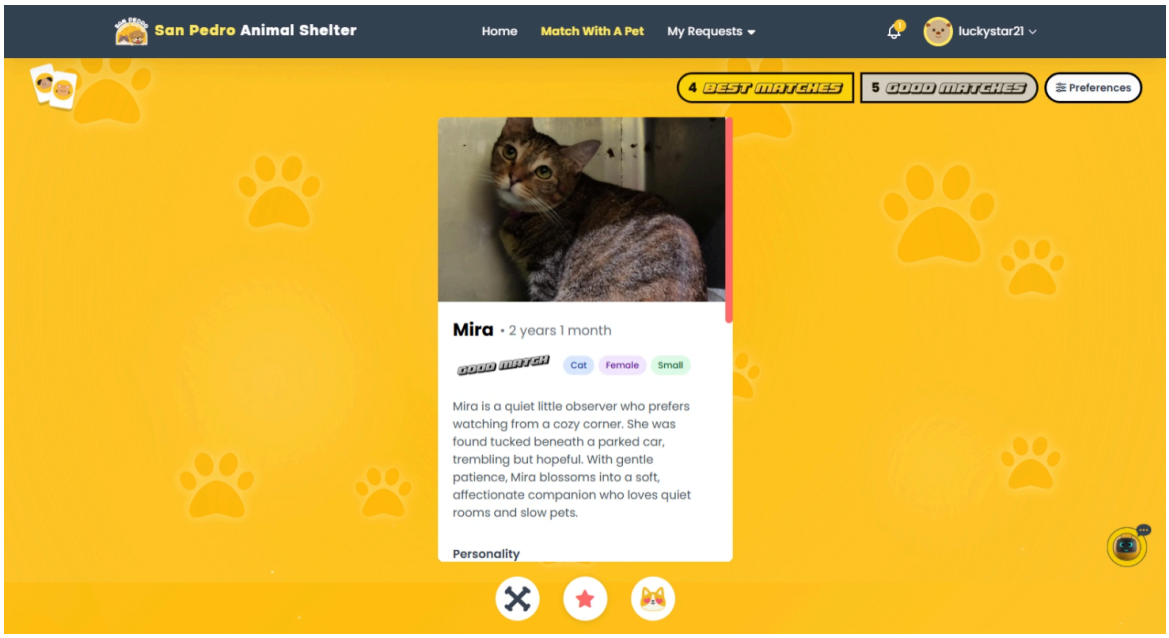

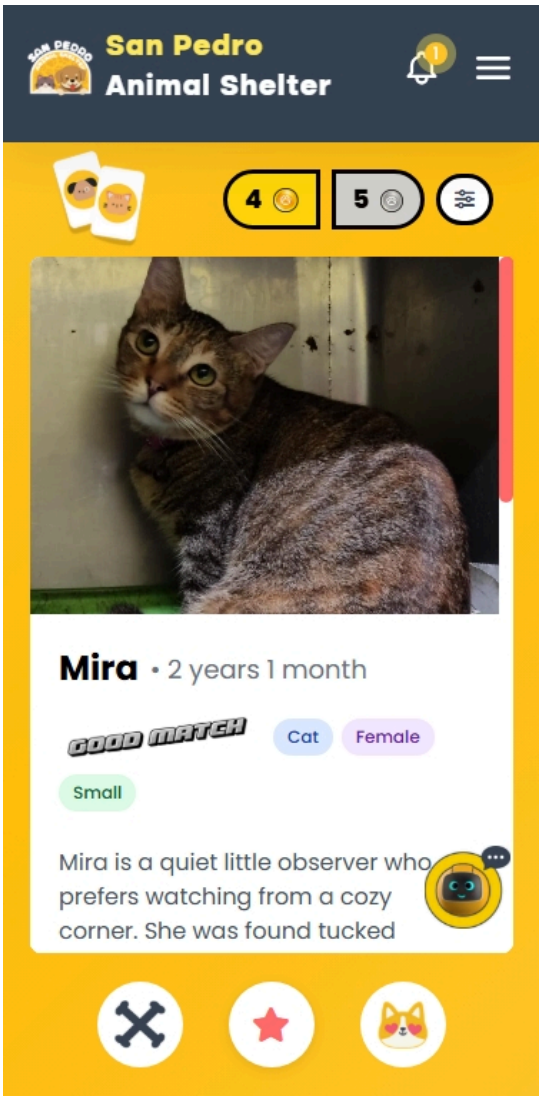

Figure 14. Pet Swipe - Mobile View

The Pet Swipe in the system was shown in Figure 46. The purpose of this page was to provide detailed information on a particular pet after the user clicks on or selects the pet's card from the matching pet listing page. Users could interact sequentially with pet profiles using the swipe-based navigation approach supported by this interface. If specific requirements were met, swiping right initiated an adoption request; swiping left allowed the user to see the next

matched pet. Additionally, consistent with the listing page, users could also edit preferences and mark pets as favorites directly from this view, making it easier to keep track of pets they were interested in without needing to return to the main list.

Each profile provided a detailed overview of the traits of the chosen pet. It provided a detailed description of the pet's behavior, lifestyle suitability, and pet's picture, name, age, species, gender, and size. Using clearly defined tags and icons, additional categories like Personality, Temperament, and Health & Compatibility were included and graphically divided. A significant section also included information about the pet's compatibility with children, dogs, and cats. This interaction approach improved user engagement by enabling quick yet well-informed decision-making, and it followed well-known swipe-based platforms.

Figure 15. Pet Comparison Page

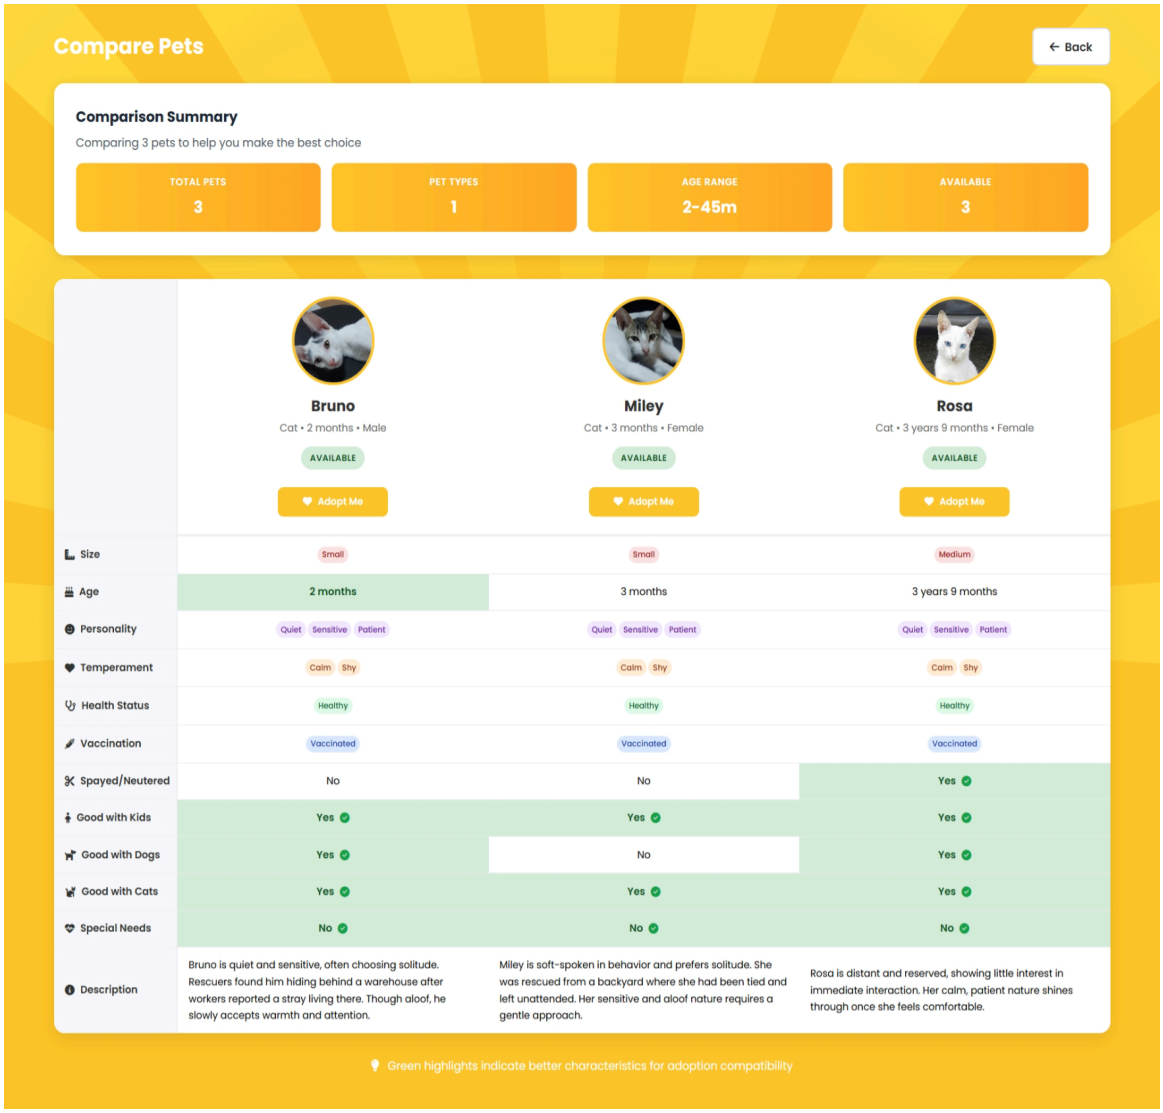

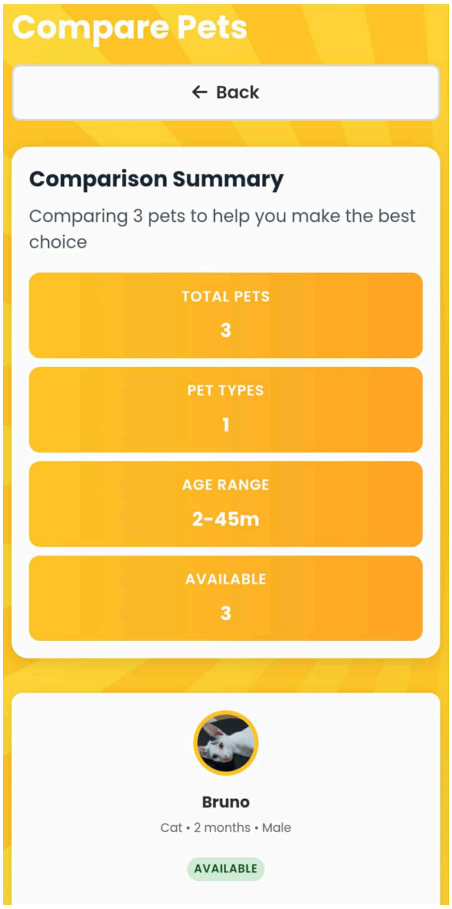

Figure 16. Pet Comparison Page - Mobile View

The Compare Pets interface served as a decision-support feature within the system, designed to allow users to perform a side-by-side comparison of multiple favorite pets. This page was accessed through the Matching page, where users could selectively toggle and compare specific pets they had previously marked as favorite. The feature was aimed at improving the decision-making process by enabling adopters to assess compatibility across various attributes in a structured, data-driven format.

The interface included a summary panel displaying the number of selected pets, pet types, age range, and availability. Each pet was shown with key details

such as photo, name, species, age, gender, and an "Adopt Me" button. Additionally, the detailed comparison included a comprehensive set of attributes, and each trait was presented in a tabular format to facilitate efficient visual comparison. To enhance usability and highlight key differences, the system employed color-coded tags and used green highlights to denote characteristics that were more favorable for adoption compatibility.

This feature enhanced the system's functionality by offering a centralized, comparative view that supported rational and user-informed decision-making. It was particularly useful for adopters who wish to thoroughly assess how potential pets align with their household environment and lifestyle requirements. By integrating this structured comparison mechanism, the system promoted more deliberate and successful adoption outcomes.

Figure 17. Adoption Request Page (Client Panel View)

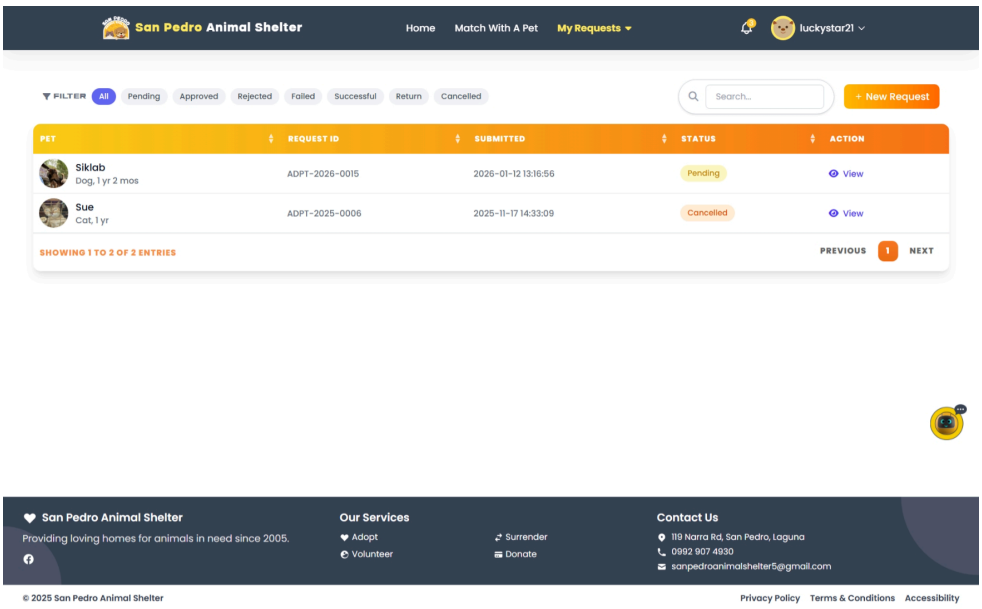

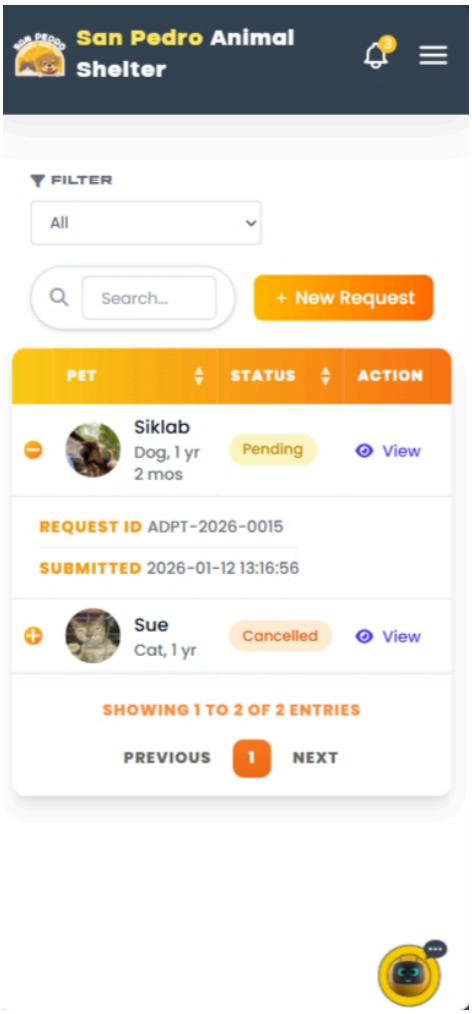

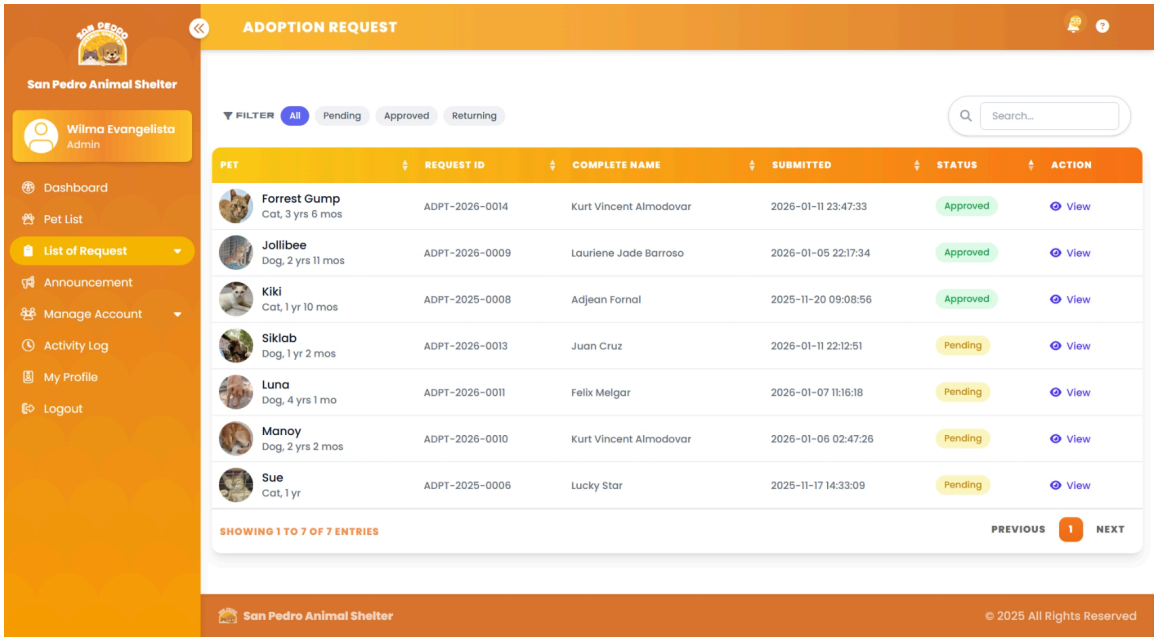

Figure 18. Adoption Request Page (Client Panel View) - Mobile View

This page was designed to allow adopters to track and manage their submitted adoption request. This helped users monitor the status of their request, view detailed information, and stay informed about the progress of their adoption application. When the Adoption Requests Page was accessed from the client panel, the system displayed Filter Options to display requests by status such as All, Pending, Approved, Rejected, Failed, Successful, Returned, Cancelled. A Search Bar was also utilized to quickly locate specific requests, and a ‘New Request’ button to initiate additional adoption applications.

Meanwhile, the request table displayed pet image, pet name and basic details, request ID (e.g., *ADPT-2025-0004*), submission date and time, and the current request status (e.g., *Pending*), action button (*View*) to open detailed request information. The system also supported pagination for managing multiple requests and provides a clear, organized view for adopters to efficiently manage their adoption interactions within the system.

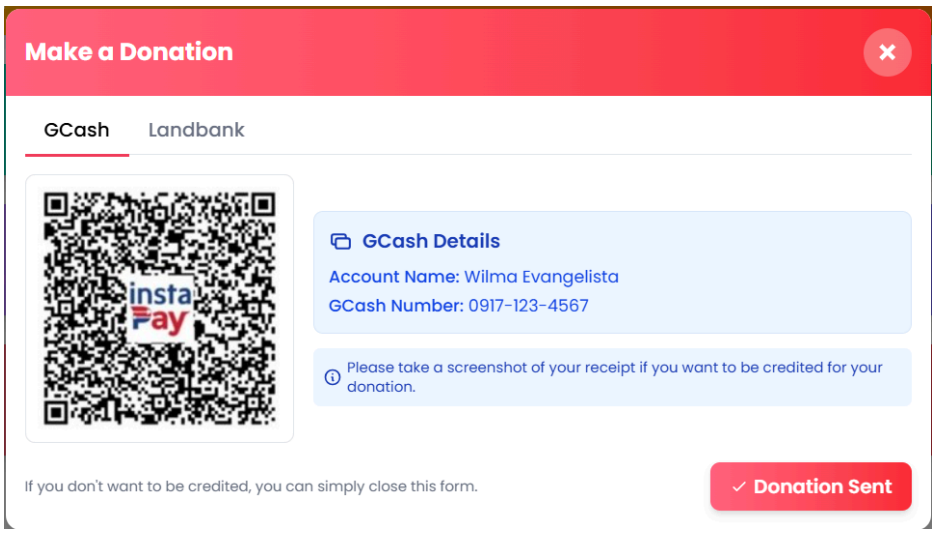

Figure 19. Adoption Request Page (Admin View)

When the “View Adoption Request List” button was clicked from the dashboard, the admin or staff was redirected to the Adoption Request Page. This page was designed to display a table that manages and monitors adoption submissions in a clean and structured layout. At the top of the table, the interface included filtering options labeled as "All," "Pending," and "Approved," which allowed users to narrow down the view based on request status. A search bar

was provided for quick lookup of specific entries. Below these controls was the main adoption request table. Each row in the table displayed essential data about an adoption submission. The table was organized with columns showing the pet image, pet name and age, request ID, the full name of the adopter, the date and time the request was submitted, the request's current status (such as Pending, Approved, Rejected, Failed, or Successful), and an action button labeled "View" that led to the full request details. This view modal also allowed administrators the option to accept or reject the adoption request. These actions were only available to requests that were in the "Pending" state. The system notified the user who made the request and updated if the request was accepted or rejected. This design ensured that admin could process multiple requests efficiently while keeping the visual structure minimal yet informative.

Figure 20. Donation Form (Client Panel View)

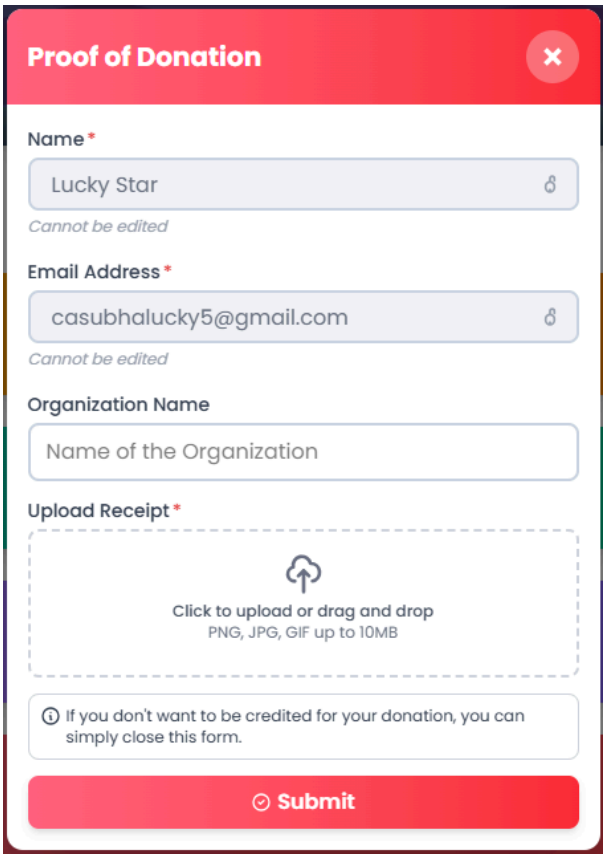

The Donation Form interface provided a simple and user-friendly channel for individuals who wished to contribute financially to support pet welfare

operations. A variety of payment methods, such as GCash and Landbank, were available to users upon entering the form, guaranteeing accessibility for a wide range of donors. Important donation details, like the account name and number, were prominently shown under the GCash Details section. The form also included a QR code that users might simply scan to complete the purchase process using their mobile wallet app.

The system had a notification asking users to take a screenshot of their payment receipt if they would like their donation to be recognized or credited in order to meet different donor preferences. In addition to offering transparency, this approach promoted accountability and trust between the organization and its donors. The system respected privacy and personal preference by providing a simple way for donors who would rather be anonymous to end the form without providing proof. The system notified the user that the transaction was completed by confirming the activity with a "Donation Sent" notification once a donation was made. The overall goal of the donation form was to enable quick, safe, and inclusive financial support for the animal shelter.

Figure 21. Proof of Donation Form (Client Panel View)

This form was intended to gather additional data from donors who would like their contributions to be recognized. Both the donor's name and email address are automatically prefilled with information taken from the user's registered account. By reducing repetitive input, this auto-population not only enhanced the user experience but also guaranteed the accuracy of donor data. Users are only asked to enter the Organization Name, which was optional and should be provided only if the donation was submitted on behalf of an organization. The "Upload Receipt" section, which enabled donors to attach visual documentation of their transaction, was a crucial component of the form. The form allowed users to pick and choose a file from their device. A receipt

could be used as a reference by donors who wanted their contributions to be formally documented as well as a verification tool for administrators.

The UI respected privacy preferences by clearly offering the option to exit the form without submitting it for those who would rather stay anonymous. The information was safely stored by the system for review and acknowledgment after the receipt had been uploaded and the form had been submitted. All things considered, this feature preserved an inclusive and user-centered experience while enhancing transparency and establishing a reliable relationship between the organization and its donors.

Figure 22. Donation Request Page (Client Panel View)

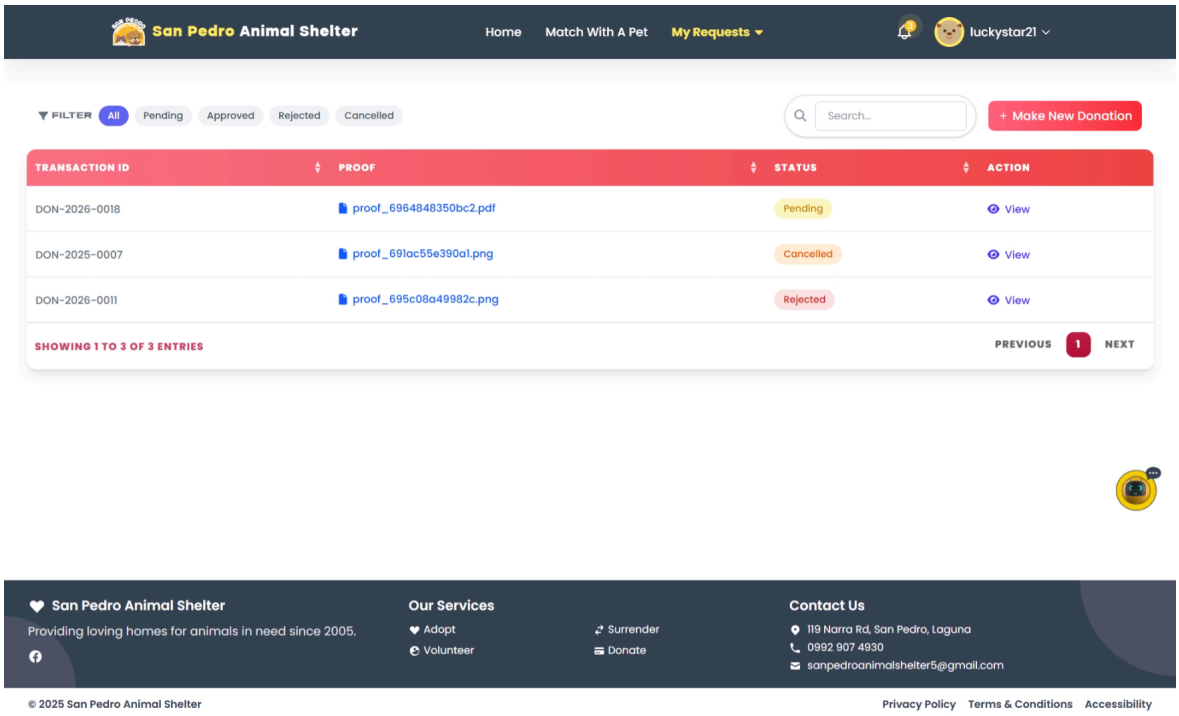

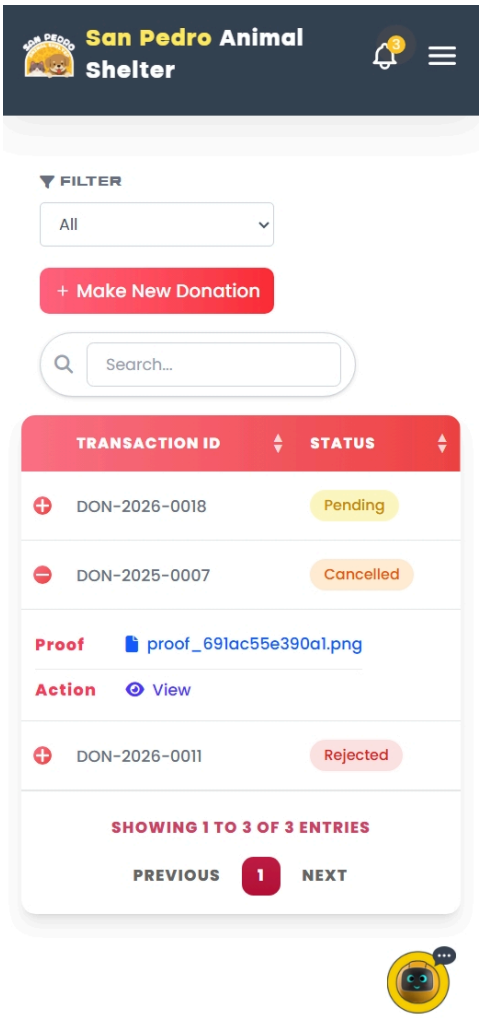

Figure 23. Donation Request Page (Client Panel View) - Mobile View

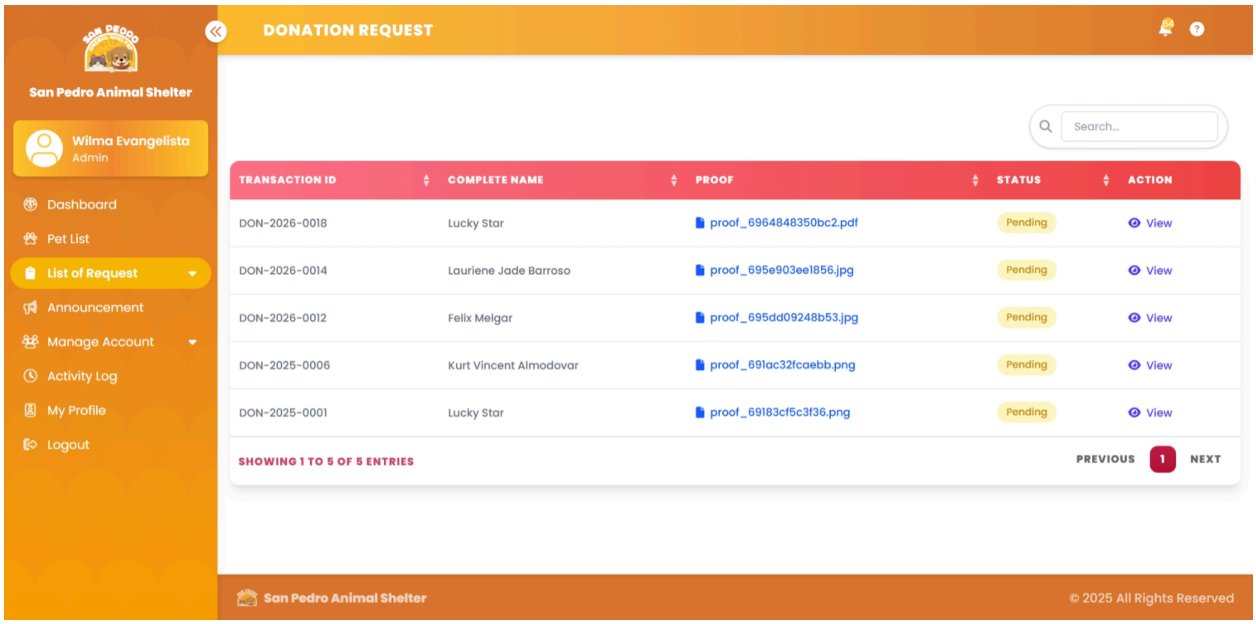

This page was designed to allow users to monitor the status of their submitted donations within the client panel. This helped users track the progress and confirmation of their donations, providing transparency and easy access to their transaction records.

When the Donation Status Page was accessed, the system displayed filter options that allowed users to view donations by status: All, Pending, Approved, Rejected, or Cancelled. A search bar was provided to help users quickly locate

specific donation records. The interface also featured a Make New Donation button that enabled users to initiate another donation transaction.

The donation table listed key information, including the Transaction ID (e.g., DON-2025-0005), the uploaded Proof of Donation (e.g., proof.png), the Current Status of each donation (e.g., Pending), and an Action Button (View) that opened detailed donation information for the selected entry. The system also supported pagination for managing multiple donation records and provides an organized, user-friendly space where donors could easily review, manage, and track their contributions to the shelter.

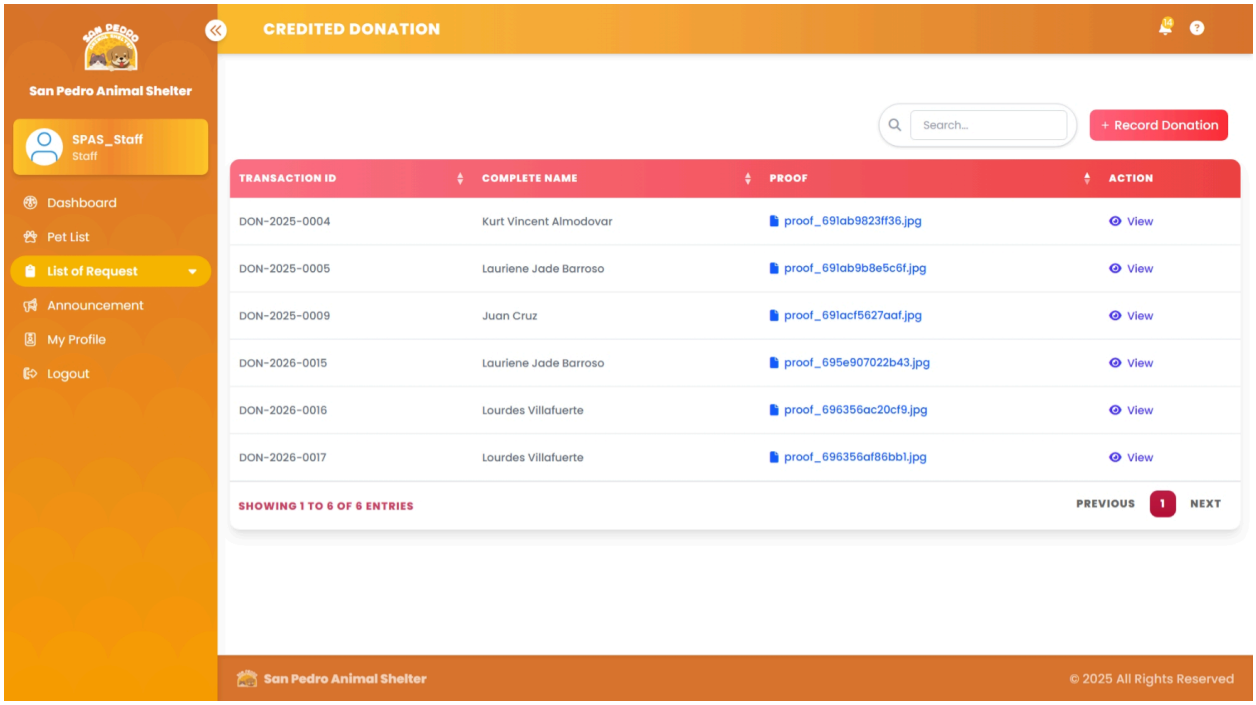

Figure 24. Donation Request Page (Admin View)

Similarly, when the “View Request List” under Donation Requests was clicked, the admin was redirected to the Credited Donation Request Page. The layout here followed a similar pattern but was simplified, focusing primarily on the

transaction data. At the top, it included a “Pending” filter and a search bar for tracking transaction IDs or names. The table included three main columns: Transaction ID, uploaded donation proof, and status. Each row ended with a “View” button for reviewing the full donation record. The credited donation request could be approved or rejected by administrators using this view modal. The system automatically updated the user who made the request and notify them if the request has been approved or rejected. This table prioritizes quick validation and approval of donations.

Figure 25. Donation Page (Staff View)

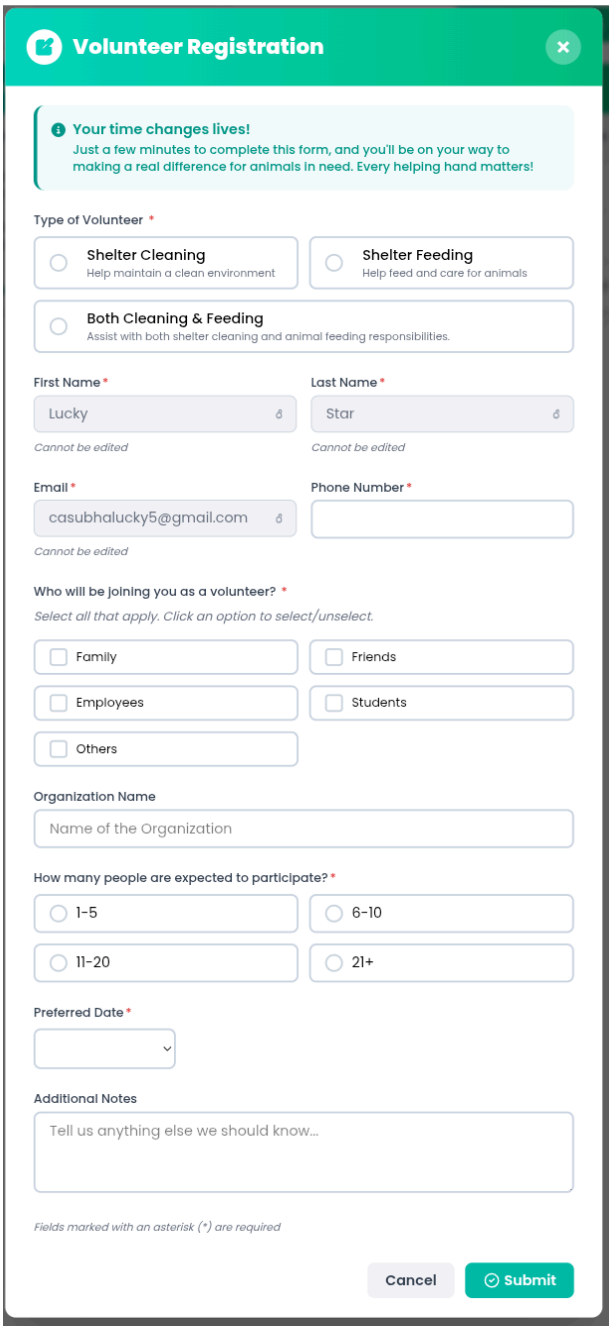

The Staff Credited Donation Page was designed for recording in-kind donations such as pet food, supplies, or shelter essentials that were personally received by staff members. When a donor requested to be acknowledged, the

staff recorded the donation by entering key details and uploading proof. A Certificate of Acknowledgement was then automatically sent to the donor's email. The page featured a table displaying all donations recorded by the staff member, including the Transaction ID, Donor's Name, and Proof of Donation.

Unlike the Admin Credited Donation Request Page, which managed client-submitted donation requests and displayed approval statuses (Pending, Approved, Rejected), the staff page did not include a status column. This was because all donations recorded by staff were automatically considered approved, as these contributions were received directly and verified at the point of entry. Staff members did not have control over donation statuses or client-side submissions. Instead, their role was focused on logging physical donations through the "Record Donation" button and maintaining a clear, verifiable donation history for transparency and acknowledgment purposes.

Figure 26. Volunteer Registration (Client Panel View)

This was designed to collect initial information from individuals or groups interested in volunteering at the shelter. This helped users quickly register their interest and allowed the shelter to schedule and prepare for volunteer activities efficiently. When the Volunteer Registration Form was accessed, the system

displayed an introductory message encouraging participation, a type of volunteer selection with visual descriptions: Shelter Cleaning and Shelter Feeding.

There were also several pre-filled fields using the information the client panel provided during sign up and those are their First Name, Last Name, and Email. The form included a multi-selection field that asks, “Who will be joining you as a volunteer?” with options such as Family, Friends, Employees, Students, or Others, followed by an optional field for the Organization Name to be filled out if the group is affiliated with an organization. It also provided group size options (1–5, 6–10, 11–20, 21+), a preferred volunteering date selection, and open text fields for Phone Number and Additional Notes, allowing users to include any relevant details or additional information.

The system displayed Submit and Cancel buttons to either proceed or exit the form. This step streamlined the volunteer process by capturing essential scheduling, group, and contact information in a user-friendly, time-efficient manner.

Figure 27. Volunteer Request Page (Client Panel View)

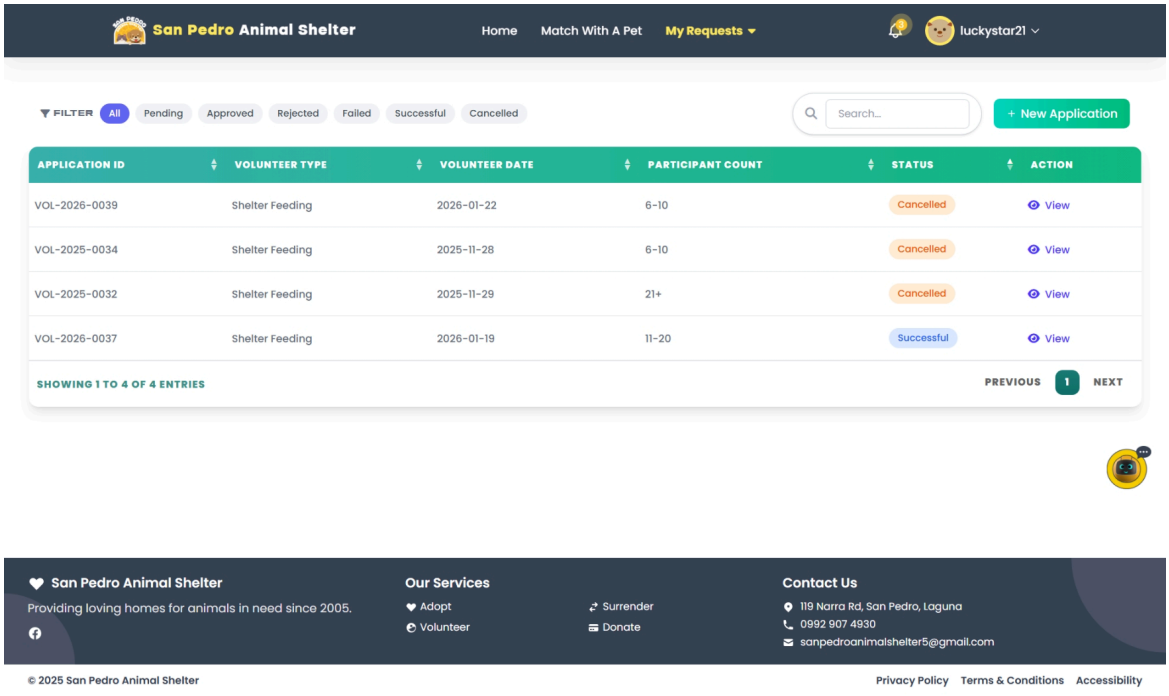

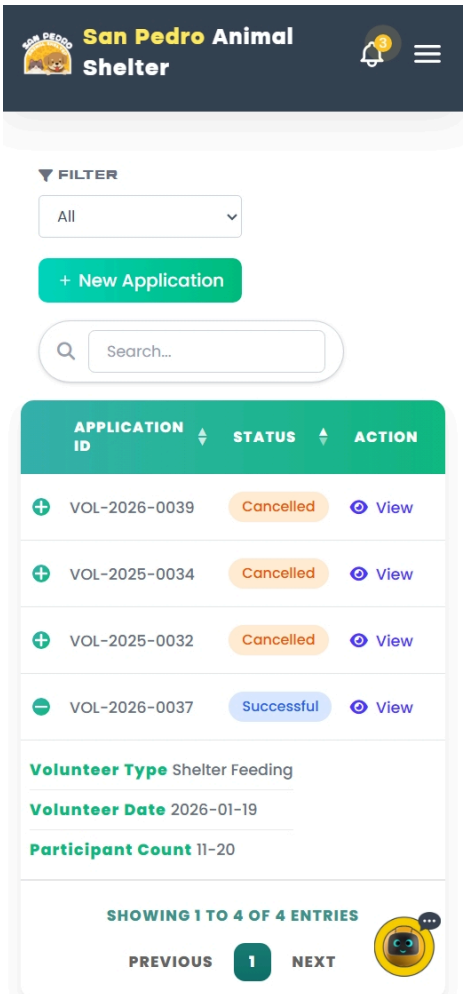

Figure 28. Volunteer Request Page (Client Panel View) - Mobile View

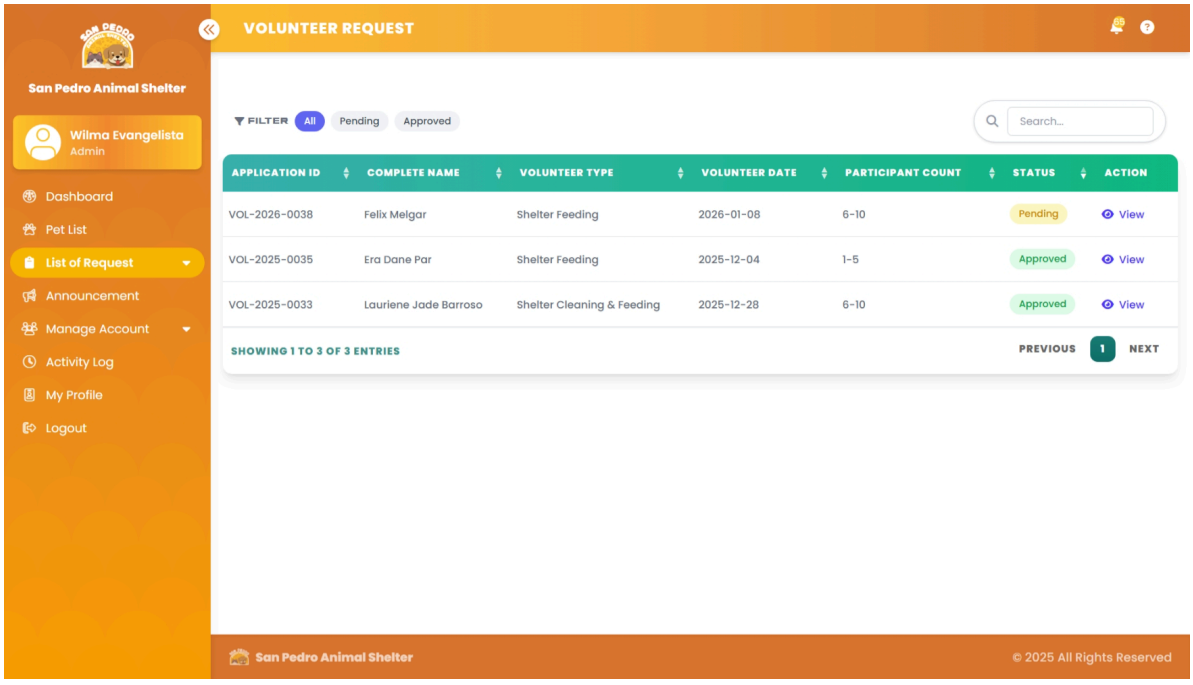

This page was designed to enable users to track the status of their Volunteer Applications within the client panel. This helped users manage their volunteer participation records and stay updated on the progress and outcomes of their applications.

When the Volunteer Applications Page was accessed, the system displays filter options to sort volunteer applications by status: All, Pending, Approved, Rejected, Failed, Successful, and Cancelled. A Search Bar was provided to

quickly locate specific applications. The interface also utilized a ‘New Application Button’ to initiate a new volunteer registration.

The volunteer applications table displayed application ID (e.g., VOL-2025-0005), volunteer type (e.g., Shelter Feeding, Shelter Cleaning), volunteer date (e.g., 2025-06-12), participant count (e.g., 1-5, 6-10), status (e.g., Pending, Successful, Failed), and an action button (View) to review detailed application information. The system supported pagination for managing multiple entries and ensured that users could easily monitor and manage their volunteer applications while providing a straightforward, organized view of their participation history.

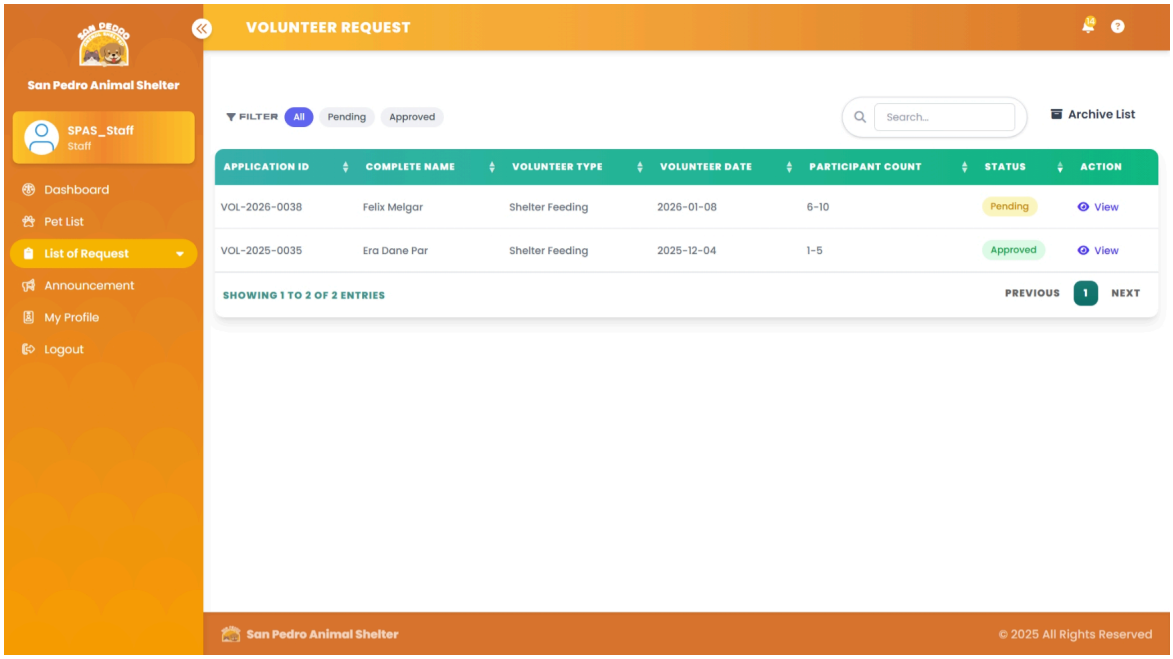

Figure 29. Volunteer Request Page (Admin View)

The Volunteer Request Page of the admin or staff handled all the volunteer applications of users. Like the others, this page began with filter options for "All," "Pending," and "Approved," accompanied by a search bar The table beneath was designed to present the application ID, volunteer activity type (e.g., Shelter Feeding or Shelter Cleaning), the scheduled date of volunteering, the number of participants, the request status (such as Pending, Approved, Rejected, Failed, or Successful), and a "View" button to review the application in detail. In this view modal, administrators and staff had the option to accept or reject the volunteer request. These actions could only be performed by requests that are in the "Pending" status. The system immediately updated and informed the user who made the request when it was accepted or rejected. This uniform design across modules allowed staff to manage different types of requests with minimal learning curve, as each table shares similar logic, styling, and user interaction flow.

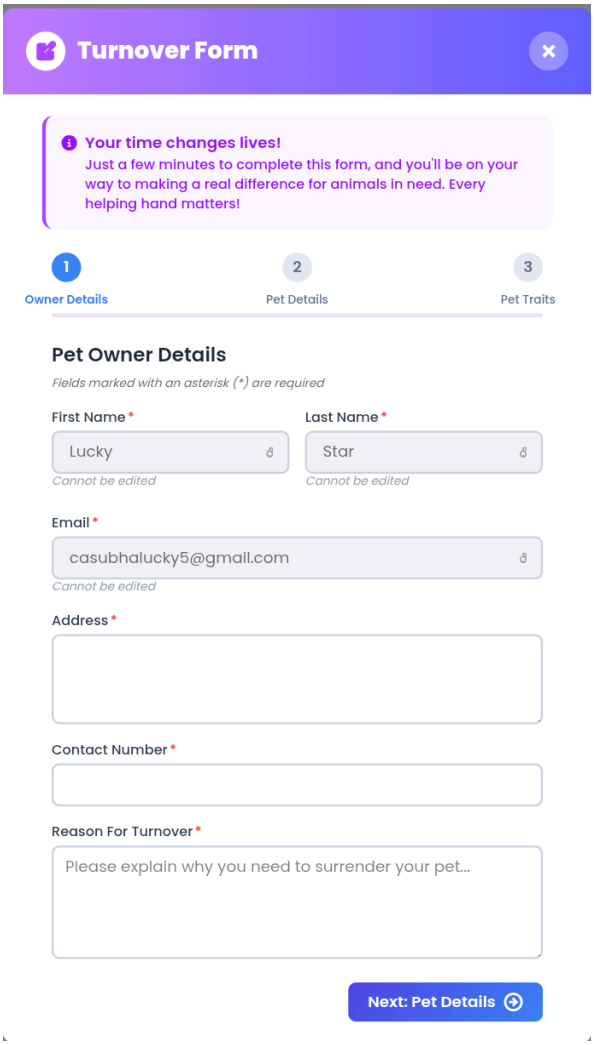

The consistent layout, with top filtering tools and clean tabular formatting, enabled the admin and staff to navigate across different request types such as adoption, donation, turnover, and volunteer seamlessly. Each page had been intentionally structured to reduce clutter, prioritize search and filtering functions, and ensure that reviewing, approving, or following up on each type of submission can be done efficiently within a few clicks.

Figure 30. Volunteer Request Page (Staff View)

The staff Volunteer Request Page shared the same core structure and functionality as the admin's page, including filtering options, search, table layout, and the ability to view volunteer applications in detail. However, the key difference was that the staff interface included an additional feature which was the Archive List link, which allowed staff to access and review previously archived volunteer applications.

Figure 31. Turnover Form - Step 1 (Client Panel View)

When the “Start Process” button, in the Pet Turnover section, was clicked from the dashboard, the system displayed the turnover form. The figure above represented the first step of the multi-step Turnover Form. It collected the surrendering owner's basic contact information: First and Last Name, Email, Address, Phone Number, and Reason for Pet Turnover (with a prompt to explain). Each field marked with an asterisk (*) was required. Once completed, users proceeded to the next step.

Figure 32. Turnover Request Page (Client Panel View)

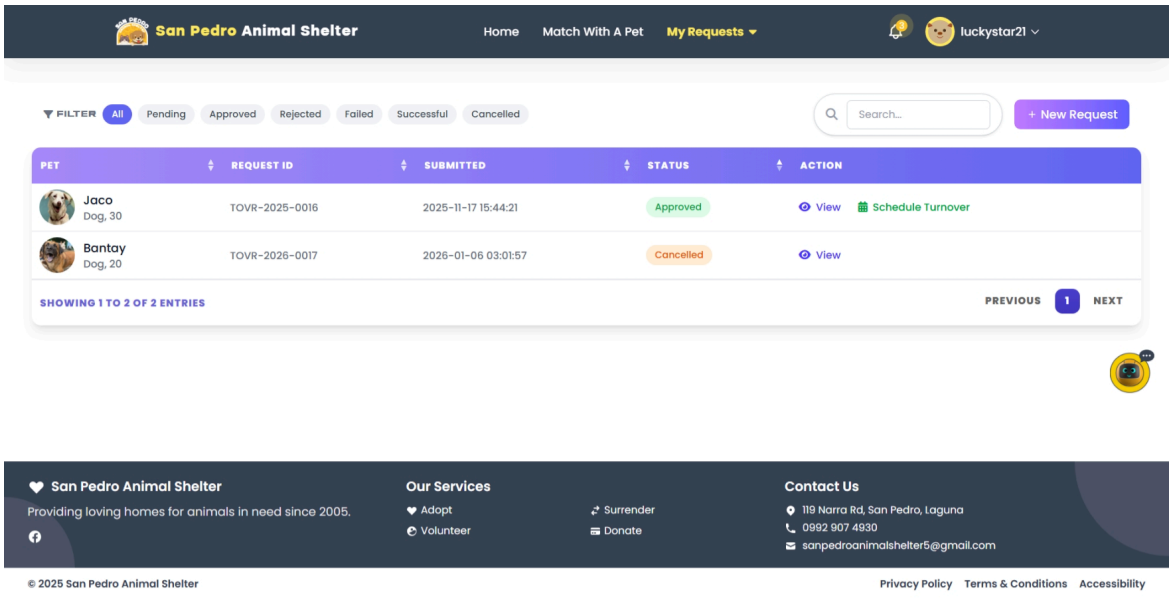

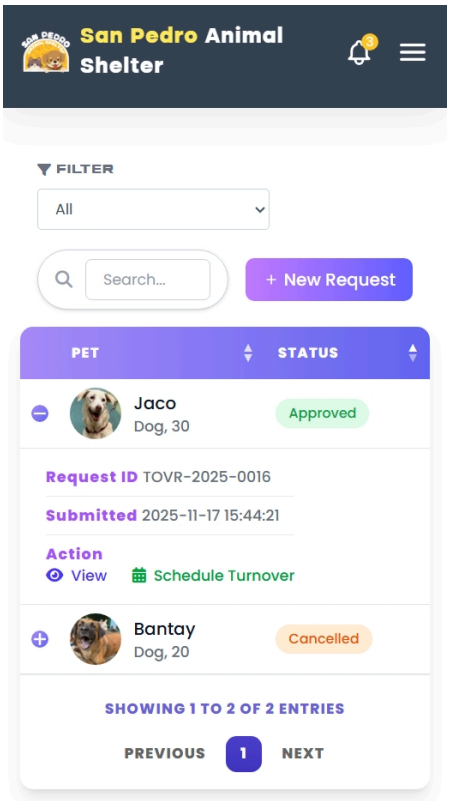

Figure 33. Turnover Request Page (Client Panel View) - Mobile View

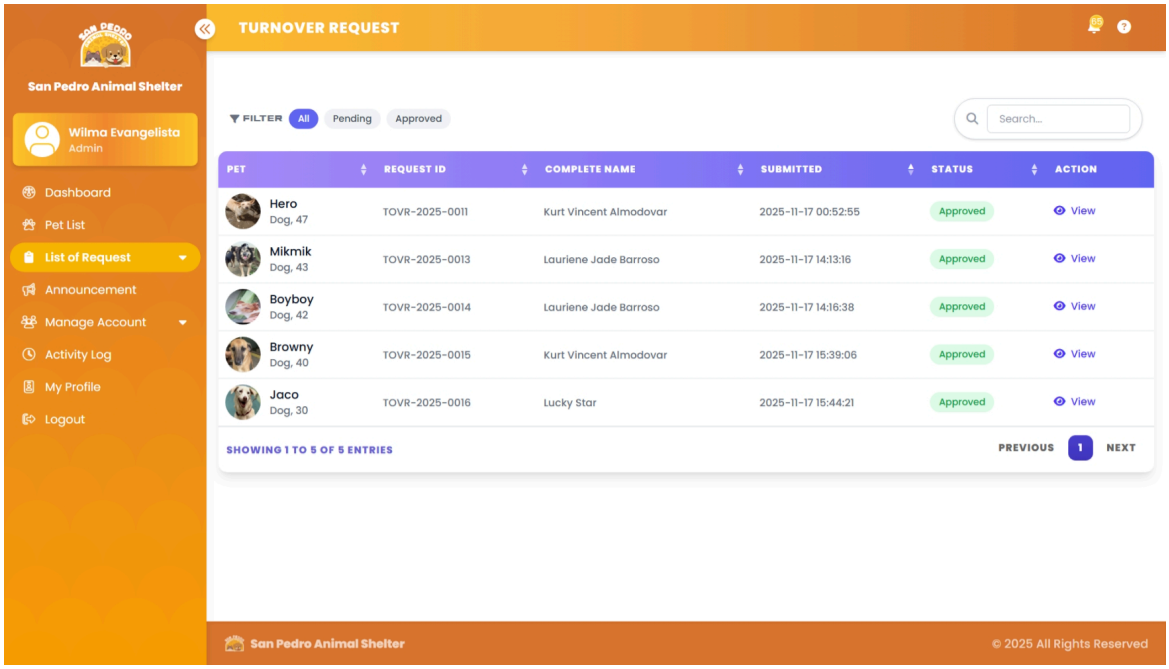

This page was designed to allow users to monitor the status of their submitted Pet Turnover Requests within the client panel. This helped users track the processing progress of their turnover submissions and provided easy access to view or follow up on their requests.

When the Turnover Requests Page was accessed, the system displayed filter options to display turnover requests by status: All, Pending, Approved, Rejected, Failed, Successful, Cancelled. A Search Bar to quickly locate specific turnover records. The interface also featured a ‘New Request Button’ to initiate a new pet turnover request

The turnover requests table listed key information, including pet information (Image, Name, Type, Age), request ID (e.g., TOVR-2025-0001), submission date and time (e.g., 2025-06-13 18:56:30), status (e.g., Pending), and Action Button (View) to open detailed turnover request information.

The system supported pagination for managing multiple turnover entries and consistently showed the footer with the shelter’s logo and copyright. This design ensured that users could conveniently track, manage, and update their turnover requests with clarity and ease.

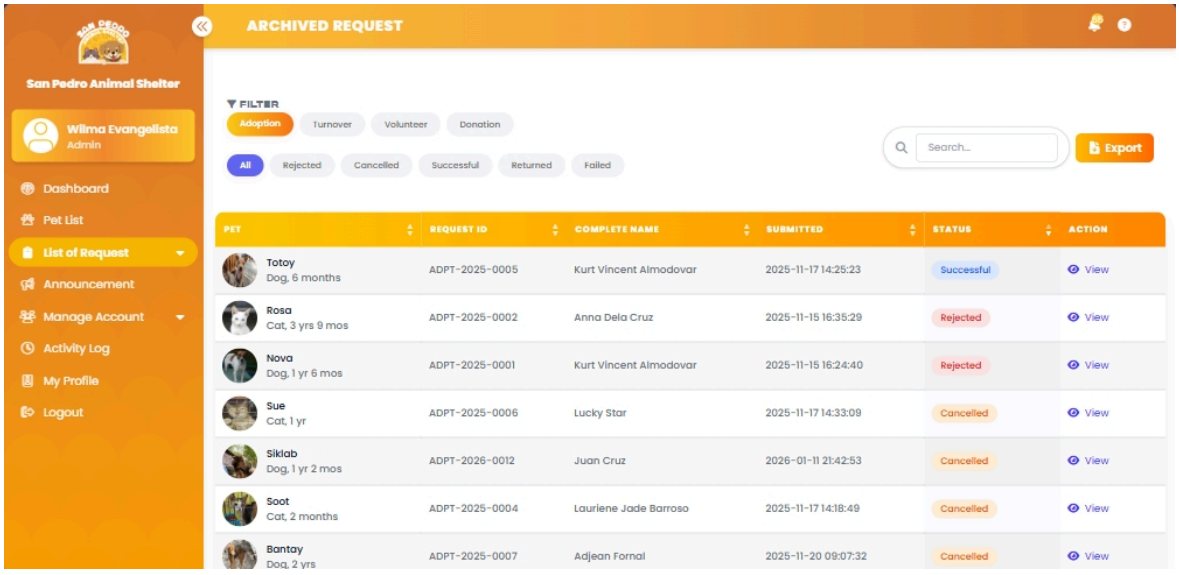

Figure 34. Turnover Request Page (Admin View)

The Turnover Request Page was structurally similar to the client panel view and functioned as a central interface for managing all pet turnover requests that had been submitted. Essential elements like status filters and a search bar for effective query-based retrieval were included in both displays. A data table that displayed important information about each turnover, such as the pet's name, age, type, and picture, as well as the request ID, submission date and time, status, and a "View" button that allowed access to the whole request details. Administrators were given the choice to approve or reject the turnover in this view modal. Only requests that had a "Pending" status could perform these actions, which were displayed as dedicated buttons. When a request was approved or denied, the system automatically updated and notified the user who submitted the request.

The addition of a column that showed the whole name of the client who submitted each turnover request distinguishes the admin panel apart from the client view. This extra feature enhanced management and accountability in the handling of turnovers by making it simple for administrators to recognize and handle requests. Additionally, pagination controls were incorporated beneath the table to facilitate scalability and user-friendliness.

Figure 35. Archive Request Page (Admin View)

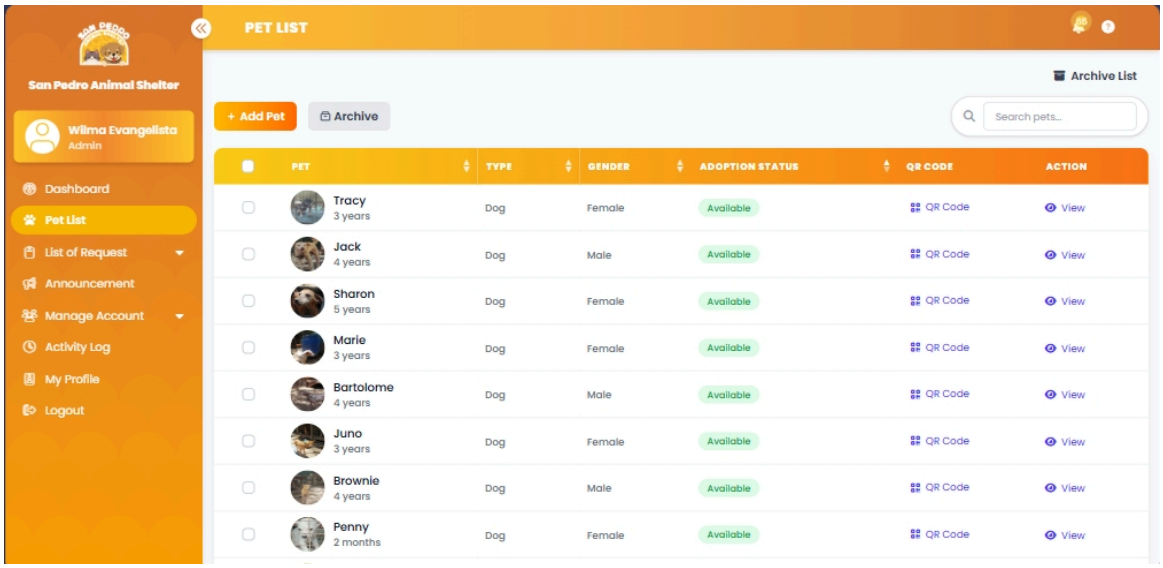

When the Archive Request page was accessed from the admin panel, the system displayed an interface designed to help administrators efficiently manage previously archived records. The interface presented Filter Options that allowed the administrator to categorize archived requests by type, including Adoption, Turnover, Volunteer, and Donation. Additional filters were provided to display requests based on their final status, such as All, Rejected, Cancelled, Successful, or Failed. To further enhance record management, a Search Bar was

provided, enabling the admin to quickly find specific archived requests using keywords or identifiers.

The main display area featured the Archive Adoption List Table, which included essential details such as the Pet Name, Request ID, Complete Name, Date Submitted, Request Status, and an Action Button that allowed the administrator to view additional request details if available. In addition to viewing archived entries, the page also provided an Export button. This feature allowed administrators to generate and download reports of archived adoption requests in a preferred format. It supported better documentation, reporting, and offline access to historical data, contributing to more efficient management and compliance with record-keeping standards..

If no records matched the selected filter or search criteria, the system displayed a message stating "No matching requests found", along with a friendly reminder to adjust the search filters or revisit the page later. A Reload Button was also available, allowing the admin to refresh the page and check for updated archived records. This process ensured that archived data remains accessible, organized, and manageable for the administrator at all times.

Figure 36. Pet List (Admin and Staff View)

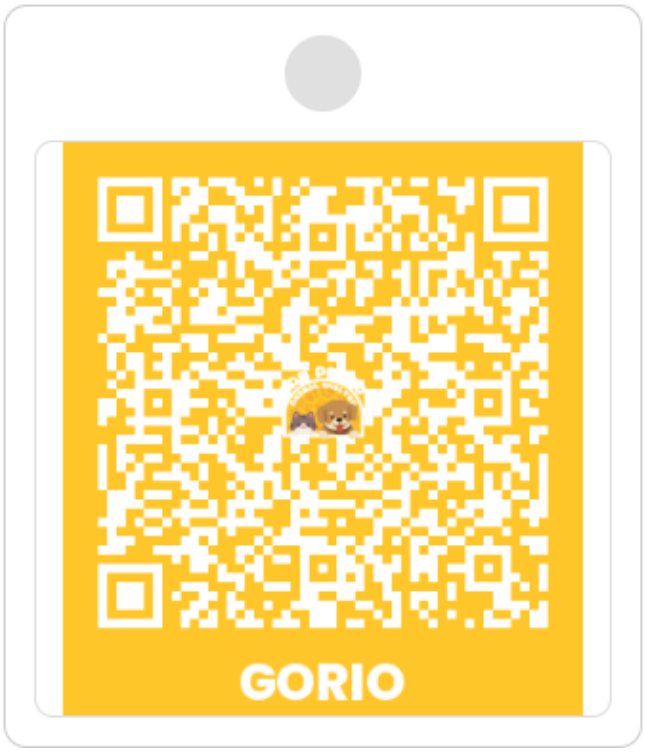

Administrators and staff might view, search, and manage every registered pet in the system using the Admin Pet List interface, which acted as a centralized management module. A checkbox for bulk actions, the pet's name, type (e.g., dog or cat), gender, adoption status (e.g., available, adopted, pending), and a QR code for each pet's unique digital profile were among the key details about each pet that were displayed in the interface, which was organized as a dynamic table. The administrator could easily check specific records by using the Action column, which offered immediate access to read detailed profiles..

To make administrative duties more efficient, important interface controls were placed above the table. With the help of the Add Pet button, administrators could enter a new pet's name, age, size, and health information into the system. An Archive button allowed administrators to move certain pets from the active list to an archive for record cleanup or status adjustments. In order to facilitate efficient data management, a search bar was incorporated to allow for immediate

keyword-based filtering. This feature reduced the amount of time needed to find particular records in a big dataset. Additionally, as the pet database grew over time, the system used pagination to improve user comprehension and load performance by breaking pet information into manageable pages.

A link to the Archive List was also provided, which took admin or staff to a different perspective of every pet that had been archived. This guaranteed that inactive entries were still available for auditing or historical reference even after they were removed from the main interface. Overall, the Pet List interface was made to help admin to handle data effectively and work more efficiently.

Figure 37. Pet QR Code

The system displayed the pet's unique QR code when the user selected the QR code option for a particular pet in the Admin Pet List interface. With the use of this feature, shelter employees could generate QR codes that were meant to be attached on the pet's collar. This functionality was essential for accelerating information access and in-shelter identification. Visitors or staff could access a digital profile with the pet's key information by using a mobile device to scan the QR code. In addition to allowing visitors to independently examine pet profiles, this eliminated the need for manual inquiries, allowing shelter staff to concentrate on operations and care.

Figure 38. QR Code Pet Profile

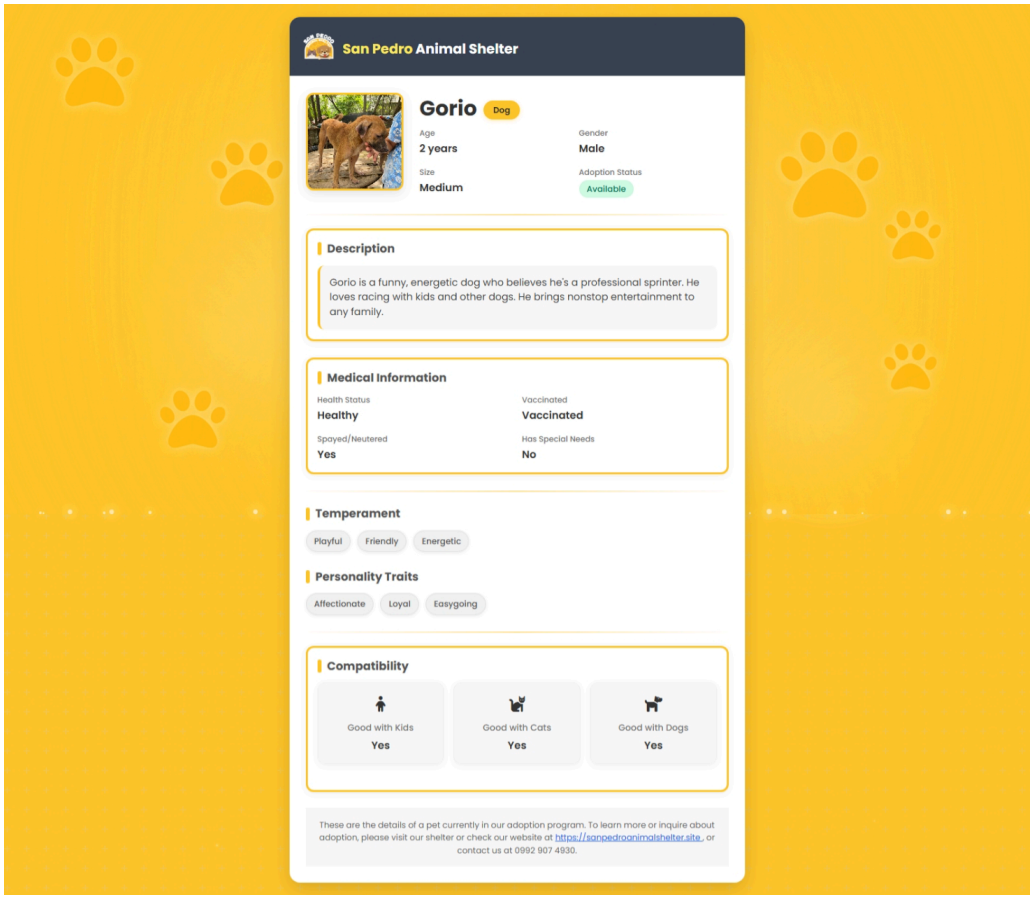

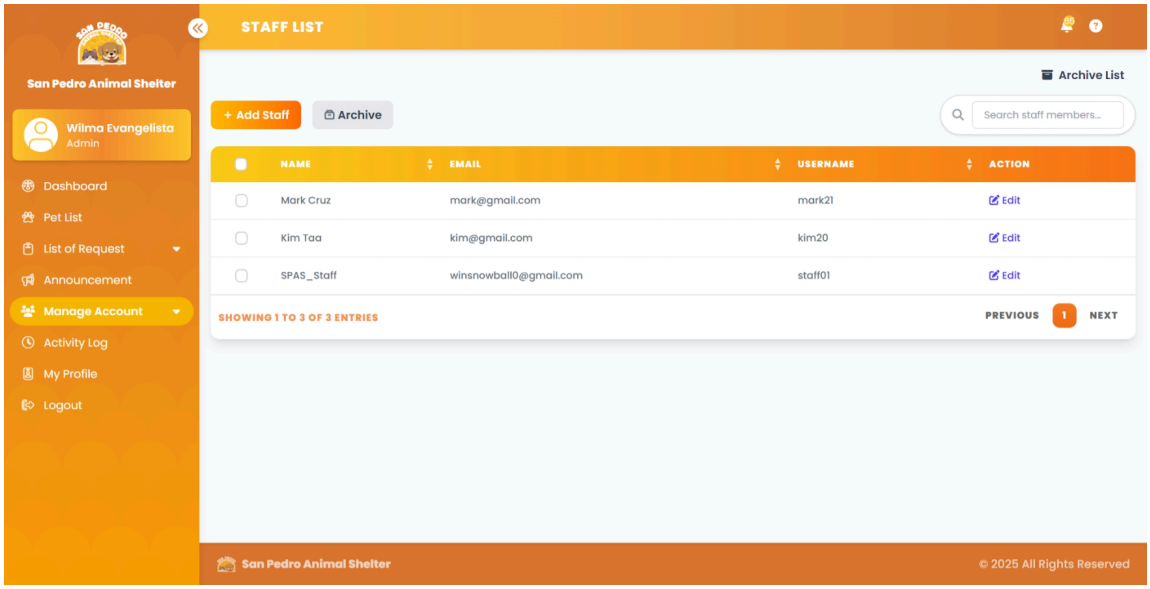

Figure 39. QR Code Pet Profile - Mobile View

This page was a dedicated section that displayed a pet's profile information upon scanning the QR code. When a visitor or staff member scanned this QR code using a mobile device, they were redirected to the Pet Profile Page that presented all relevant details about the pet such as name, age, gender, personality traits, temperament, health status, and compatibility with other animals or children.

The QR code method not only increased visitor interaction but also enhanced internal tracking and record access. Staff might instantly confirm pet information on the scene, which was particularly helpful for feeding, health examinations, and turnover procedures. All things considered, this feature made the process of handling animal information in a shelter setting more effective, structured, and modern.

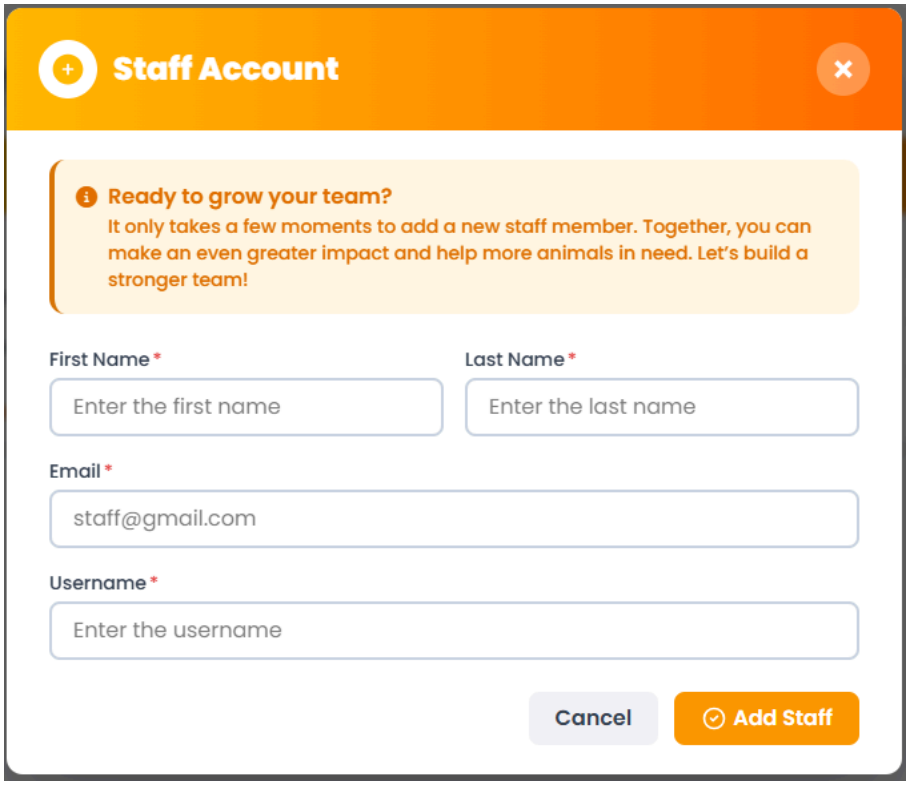

Figure 40. Staff List

The Animal Shelter Administration System's Staff List interface was made to facilitate efficient staff administration. Each staff member's full name, email address, and system-assigned username were among the important details displayed in a tabular manner. In order to maintain correct and current data, this design also incorporated an Action column that gave administrators the opportunity to modify staff details. This established format facilitated role-based account administration and provided quick access to crucial personnel data.

The interface's search bar, which was particularly helpful in shelters, allows admin to rapidly locate certain staff profiles, significantly improving functionality. Additionally, there were integrated key action buttons, such as an Add Staff button for adding new staff to the system and an Archive button for deactivating inactive staff members. For the sake of accountability and record-keeping, archived records were moved to a distinct Archive List area rather than being deleted. In the shelter context, this design guaranteed effective staff management while preserving the accuracy and traceability of all personnel data.

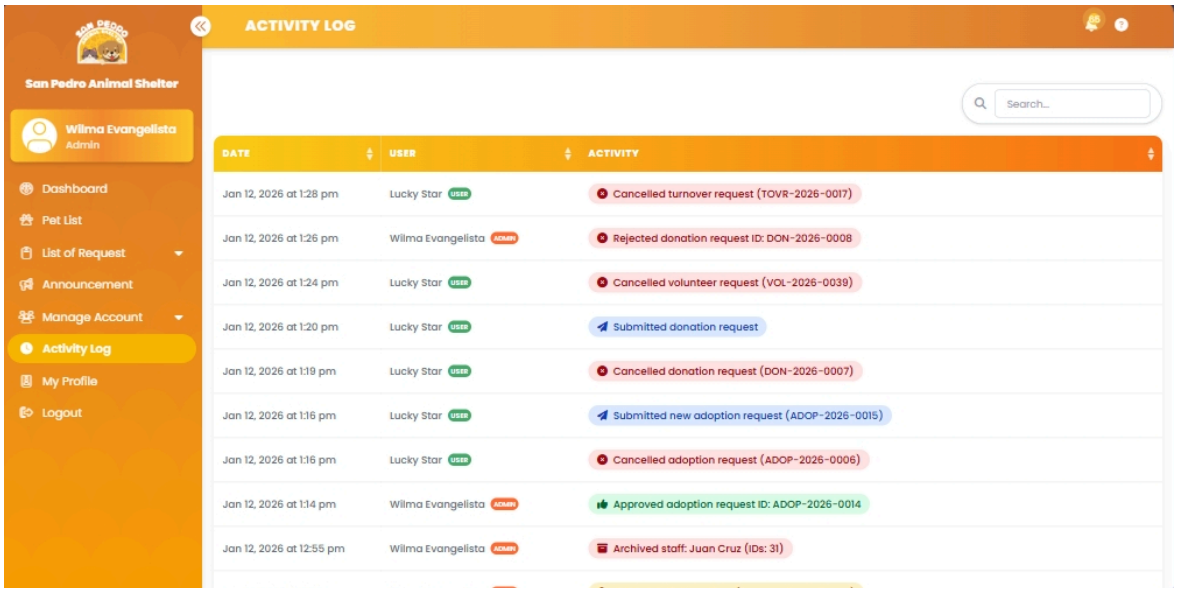

Figure 41. Add Staff Modal (Admin View)

The Add Staff modal was an integral part of the Animal Shelter Management System, designed to facilitate the registration of new staff members. Presented as a pop-up form, this interface allowed administrators to input key details such as First Name, Last Name, Email, and Username. A brief introductory message at the top of the modal encouraged team growth and emphasizes the collective mission of helping animals in need. The layout was clean and focused, allowing for a quick and efficient process of adding staff without navigating away from the main Staff List page.

Once the required information was entered and submitted, the system automatically generated a secure password for the new staff account. The username and password were then sent directly to the staff member’s registered email address, ensuring that login credentials were delivered safely and efficiently. This automated process reduced administrative workload and enhanced accuracy. Additionally, a Cancel button was provided to allow administrators to exit the modal without saving any changes. Overall, the Add Staff modal supported smooth staff registration, promoted security, and contributed to the organized management of personnel within the shelter system.

Figure 42. Admin Activity Log

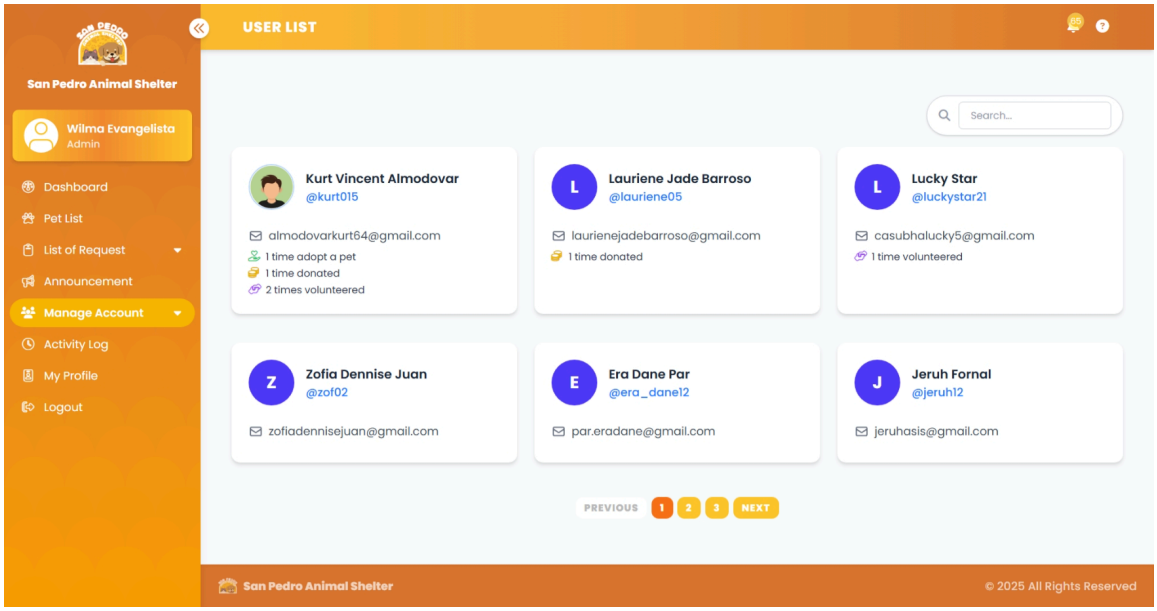

The Activity Log served as a vital component of the Animal Shelter Management System, designed to provide a transparent and traceable record of user actions within the platform. Presented in a tabular format, the Activity Log included three primary columns: Date, User, and Activity. This allowed administrators to monitor system usage and review specific operations performed by staff or admin users. Activities such as adding pets, editing profiles, archiving records, or generating reports were logged with time-stamped accuracy, supporting both accountability and auditability.

A Search bar was positioned above the log table, enabling users to filter records based on keywords, usernames, or specific actions. This feature was particularly useful in identifying recent changes, investigating issues, or reviewing historical activity over a given period. The Activity Log contributed to system integrity by ensuring that all significant actions were recorded and viewable by

authorized personnel. It promoted responsible system use, facilitated performance tracking, and reinforced administrative control within the shelter environment.

Figure 43. User Account List (Admin View)

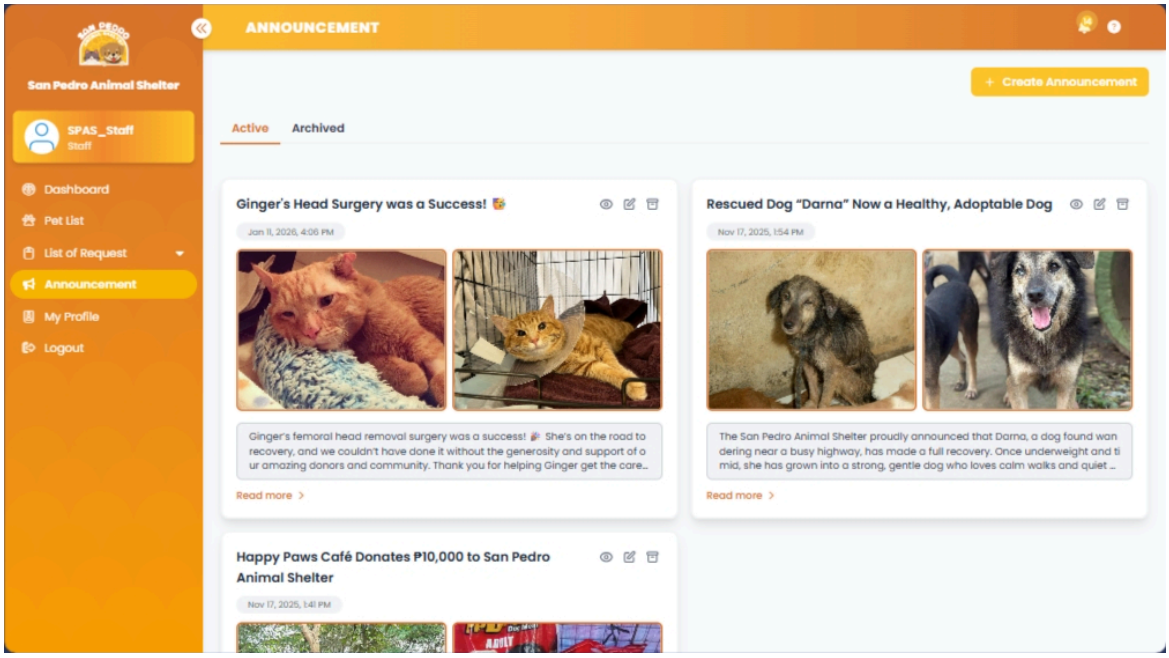

The User List interface was designed to provide administrators with a comprehensive overview of individuals who had engaged with the animal shelter through the system. Each user entry displayed personal and engagement details such as the full name, username handle, and email address, allowing staff to quickly identify and verify user accounts. This structured layout helped the shelter maintain organized records of users while also supporting communication and account management tasks.

In addition to basic user information, the system tracked and displayed each user's history of involvement with the shelter. This included metrics such as

the number of times a user has adopted a pet, volunteered, or donated. By showing engagement frequency (e.g., “1 time adopt a pet,” “2 times volunteered,” “2 times donate”), the User List enabled staff to recognize active participants and potentially reach out to them for future activities or support. This feature not only aided in user monitoring but also promotes relationship-building between the shelter and its community supporters. To enhance accessibility and efficiency, the User List includes a search bar, allowing admin to quickly locate specific users based on keywords or names. Additionally, pagination was implemented to manage large numbers of user entries, ensuring the list remained easy to navigate and organized without overwhelming the interface.

Figure 44. Staff Announcement List

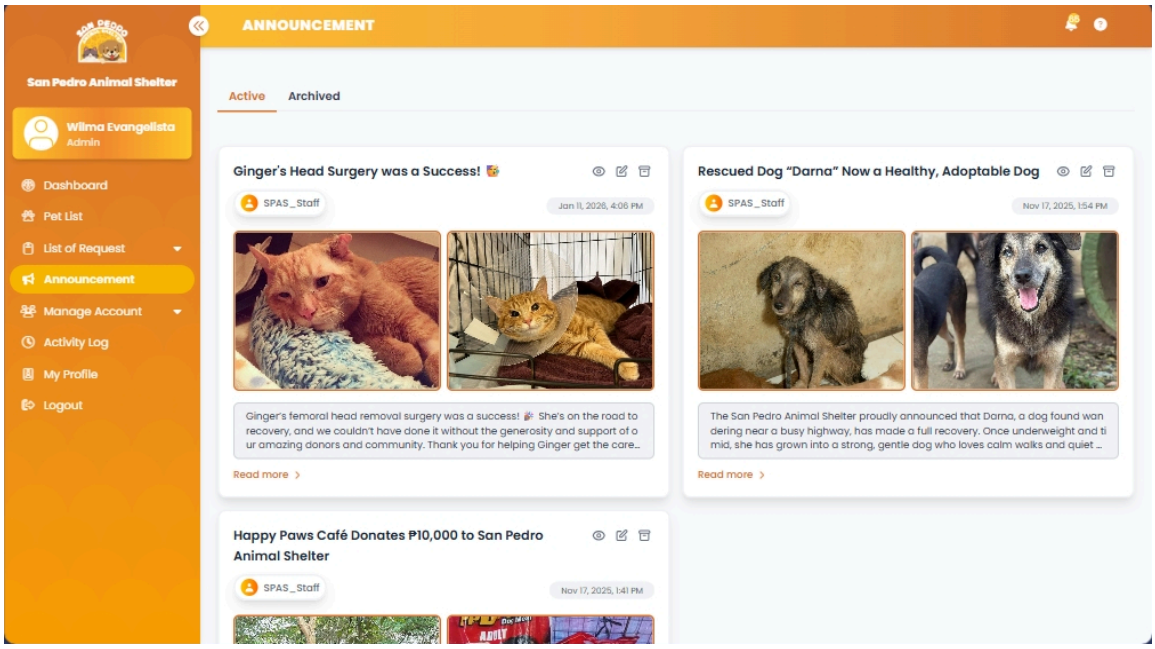

The Staff Announcement page in the Animal Shelter Management System allowed each staff member to manage announcements that were shown to

users. A staff member could view only the announcements personally created, ensuring clear ownership over posted content. The page provided the ability to add new announcements, edit previously posted ones, and archive announcements that were no longer needed or relevant.

This feature supported staff in keeping users informed with timely updates such as upcoming events, pet availability, or important shelter notices. Archiving allowed older announcements to be hidden from a public view without being permanently removed, helping maintain an organized and accurate announcement section. By giving each staff member control over individually posted announcements, the system promoted responsible and consistent communication with users.

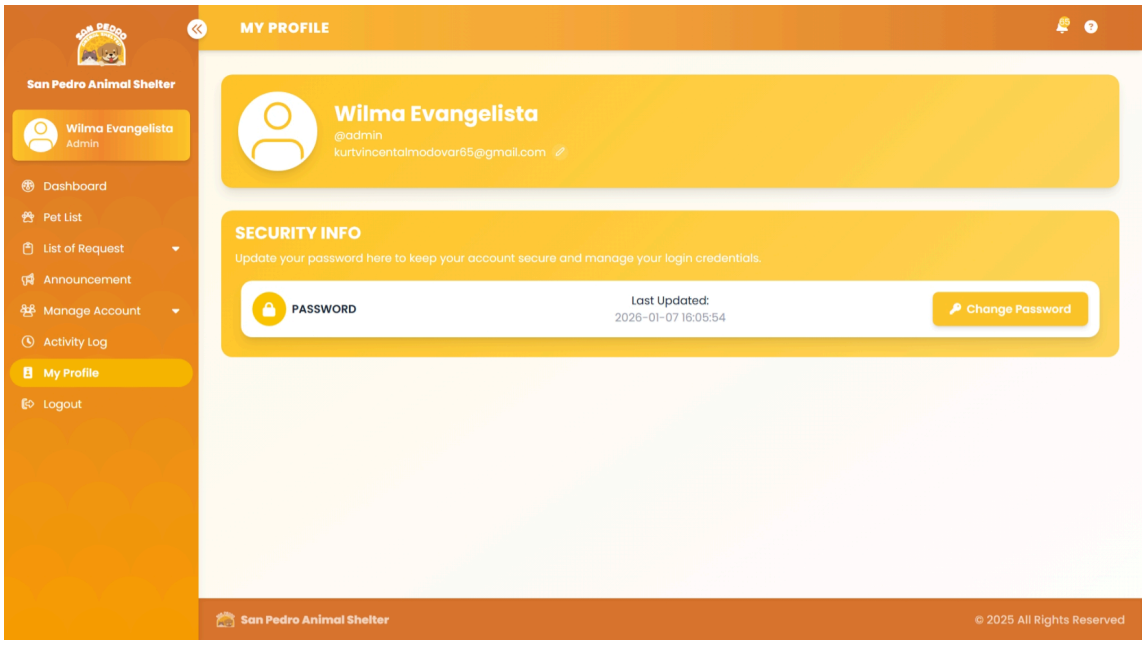

Figure 45. Admin Announcement List

The Announcement List was a dedicated page within the Animal Shelter Management System that allowed the admin to view all announcements created by staff members. While the admin did not have the capability to create new announcements, they were authorized to modify existing announcements and archive them as necessary. This helped ensure that users only see accurate and up-to-date information.

By managing the visibility and accuracy of announcements, the admin helped maintain the announcement page as a reliable communication channel between the shelter and its users. Archiving allowed outdated posts to be hidden without being permanently deleted, preserving a record of previous announcements. This functionality supported clarity, accountability, and proper administrative control over the information presented to the public.

Figure 46. My Profile (Admin and Staff View)

The My Profile section for administrator and staff in the animal shelter management system was intentionally designed with limited functionality to maintain system integrity and minimize risks associated with unauthorized data changes. Unlike client profiles, which contained extensive personal and adoption-related information, the admin profile focused solely on essential account management. This page allowed administrators to update their profile picture for identification and personalization within the system, to change their email address, and to change their password to uphold account security. This process promoted a secure administrative environment while keeping the interface clean and easy to manage for staff overseeing the shelter’s operations.
